PREFACE

The 1960 edition of the Canada Year Book continues a series of annual publications giving official statistical and other information on almost every measurable phase of Canada's development. As the economy of the country has expanded, the Dominion Bureau of Statistics has endeavoured to present the story of this development, summarizing a great mass of detailed statistical information concisely within the covers of one volume and supplementing it with data from other Departments of the Federal Government and from the provinces.

Special feature articles are presented in each edition of the Year Book. Those in the current issue include: "The Geological Survey of Canada" (pp. 13-19); "Climatic Tables"—supplementing the study on The Climate of Canada appearing in the 1959 edition—(pp. 31-77); "Hospital Services and Hospital Insurance in Canada" (pp. 281-290); "The Revolution in Canadian Agriculture" (pp. 434-439); "Canada's Commercial Fishery Resources and Their Conservation" (pp. 625-630); "The St. Lawrence Seaway in Operation" (pp. 851-860); and "The Board of Grain Commissioners" and "The Canadian Wheat Board and Its Role in Grain Marketing" (pp. 957-960).

Extensive revisions have been made in the textual and statistical material of the various chapters, particularly with regard to the machinery of government, the native peoples of Canada, public health and welfare, scientific, medical and industrial research, power generation and utilization, mineral production, manufacturing, transportation and communications, the domestic marketing of commodities, foreign trade, national income and expenditure and Canada's investment position. In addition, new features have been introduced covering such subjects as the national parole system, space research, and controls over the pricing and marketing of farm products other than grain. The Introduction (pp. xi-xv) describes briefly the state of the economy during the first half of 1960.

The concluding chapter, entitled "Sources of Official Information and Miscellaneous Data", presents reference material listing government information services, special material published in earlier Year Books, federal legislation of the 1960 session of Parliament, a Canadian chronology of events, a register of official appointments, and a statistical summary of the progress of Canada since 1871. In the Appendix certain material on Government (Chapter II) is brought up to the date of going to press, including recent election results in the provinces and changes in the Eighteenth Ministry of Canada.

Enclosed in the pocket on the inside back cover of the volume is a detailed political map.

The present volume has been produced in the Canada Year Book Section of the Information Services Division by Miss M. Pink, Assistant Editor of the Year Book and Chief of the Section, and the Year Book staff under the editorship and direction of Dr. C. C. Lingard, Director of the Division. Charts, graphs and maps have been prepared for publication by Miss P. Beland, the Drafting Unit of the Bureau, and the Surveys and Mapping Branch of the Department of Mines and Technical Surveys.

The co-operation of numerous officials of the various Departments of the Federal and Provincial Governments and of this Bureau in the preparation of material for the Year Book is gratefully acknowledged. Credit by means of footnotes is given where possible either to the persons or to the branches of the public service concerned.

WEIGHTS AND MEASURES AND OTHER INTERPRETATIVE DATA

In Canada as a rule the Imperial system of weights and measures is followed. An exception, however, is the ton where, unless otherwise stated, the short ton of 2,000 lb. is meant. Billion where used represents 1,000 million.

The following table shows the weights and measures used in Canada in connection with the principal field crops and for wheat flour and fruits:—

	<i>Pounds per Bushel</i>		<i>Pounds</i>
Grains—		Fruits (standard conversions)—	
Wheat.....	60	Apples, per barrel.....	135
Oats.....	34	Apples, per box.....	43
Barley.....	48	Pears, per bushel.....	50
Rye.....	56	Plums " ".....	50
Buckwheat.....	48	Cherries " ".....	50
Flaxseed.....	56	Peaches " ".....	50
Corn.....	56	Grapes " ".....	50
Mixed grains.....	50	Pears, per box.....	42
All others.....	60	Strawberries, per quart.....	1.25
		Raspberries " ".....	1.25
		Loganberries " ".....	1.25

Wheat Flour—

1 barrel equals 196 pounds; approximately
4.5 bushels of wheat are used in the production
of a barrel of flour.

Relative Weights and Measures, Imperial and United States

The following list of coefficients may be used to translate amounts expressed in one unit to the other. It must be borne in mind that where the list below refers to Imperial pint, quart and gallon, their equivalent in ounces is also in Imperial measure; likewise United States designations for these quantities are shown in the U.S. equivalent in ounces. The Imperial (or British) fluid ounce and the U.S. fluid ounce are different measures. One Imperial fluid ounce equals 0.96 United States fluid ounce and one Imperial gallon equals 1.2 United States gallon.

1 Imperial pint=20 fluid ounces.	1 Imperial proof gallon=1.36 United States proof gallon.
1 United States pint=16 fluid ounces.	1 short ton=2,000 pounds.
1 Imperial quart=40 fluid ounces.	1 long ton=2,240 pounds.
1 United States quart=32 fluid ounces.	1 barrel crude petroleum=35 Imperial gallons.
1 Imperial gallon=160 fluid ounces.	1 ounce avoirdupois=0.91146 ounce troy (oz. t.)
1 United States gallon=128 fluid ounces.	

Fiscal Years of Federal and Provincial Governments

The fiscal year of the Federal Government and of each of the ten Provincial Governments ends on March 31.

Throughout the Year Book, fiscal year figures are indicated in the text and headings of tables; otherwise, figures are for calendar years.

INTRODUCTION

THE CANADIAN ECONOMY IN THE FIRST HALF OF 1960

The strength of expansionary forces in Canada waned in the first half of 1960, following two years of rising economic activity. The pace of advance slackened in the first quarter and the second quarter brought a small decline in the gross national product, when seasonal factors are taken into account. Nevertheless aggregative measures of activity were above the like period of 1959. Thus, the gross national product was running at a seasonally adjusted annual rate of \$35,336,000,000, which was more than 3 p.c. higher than a year earlier; about half the increase represented higher prices. At the same time employment was up about 2 p.c. but the gain failed to match the growth in the labour force, leaving an increased rate of unemployment.

The easing in activity during the first half of the year was related to a sharp reduction in house-building and to a declining rate of accumulation of stocks. Investment in plant and equipment remained fairly high but failed to exert the expansionary influence that had been anticipated early in the year. Consumer spending continued to rise but at a significantly lower rate than in the same period a year earlier; the contrast between the two periods in the consumer market for durables was particularly evident in purchases of automobiles.

Foreign demand for Canadian export products continued to increase and the vigorous expansion in sales to the United Kingdom and countries of the European Common Market was a notable development of the first half of 1960. At the same time, imports recorded a relatively small advance, reflecting the easing in demand in certain areas in Canada. Thus, the deficit on current international account was considerably lower than a year earlier.

This changing pattern of demand was mirrored in the flow of income. Business income, both corporate and unincorporated (non-farm), was adversely affected and rates of increase in personal disposable income were retarded. Government revenues were notably higher, thereby substantially reducing the deficit.

The following paragraphs describe in more detail the changes in the components of demand and in income flows and the movements in production, employment and prices associated therewith in the first half of 1960. Where available, additional information is presented on trends emerging in the second half of the year.

THE COMPONENTS OF DEMAND

While the consumer sector gave a forward impetus to the economy during the first half of 1960, its expansionary influence was not so strong as it had been in most of the years of the postwar period. Expenditure on consumer goods and services was at a seasonally adjusted annual rate of \$22,864,000,000, an increase of 4 p.c. over the same period of 1959, which compares with a gain of 6 p.c. in the first six months' comparison a year earlier. In real terms, the gain in 1960 was somewhat below the average for postwar years. A somewhat smaller-than-average rise in real disposable income was associated with this development in consumer spending. The rise in spending in the first half of 1960 considerably exceeded the gain in disposable income, thus reducing the rate of personal saving significantly below the relatively high level that had prevailed in the same period of 1959. At the same time, consumer credit outstanding at mid-1960 was notably higher than a year earlier.

An easing in demand for durable goods was an outstanding feature of consumer markets in the first half of 1960. Purchases of all major categories of durable goods were

somewhat lower than they had been in the same period of 1959 when the market for durables had been notably buoyant. The contrast was especially marked in sales of new and used cars which rose 14 p.c. in the first half of 1959 and fell more than 2 p.c. in the first half of 1960; a clear-cut contrast was also evident in the sales of radios and appliances which rose 7 p.c. in the first comparison and fell 3 p.c. in the second. It seems likely that the drop in sales of household durables reflected in part the steep decline in housing activity from the extremely high rates characteristic of 1958 and 1959. Spending on durables as a group was down about 1.5 p.c.

The increase in spending was concentrated in the non-durable and service categories, with gains of more than 4 p.c. in the former and 5.5 p.c. in the latter. The increase in spending on non-durables matched fairly closely that of the comparable period of the previous year. Consumer spending on services continued to reflect a significant element of price increase.

Turning to consider housing, which is closely related to the consumer sector, outlays in the first half of 1960 were running at an annual rate of \$1,552,000,000, more than 11 p.c. lower than in the like period of 1959. This decline was related in part to the stringency in mortgage markets, particularly as it affected lending under the National Housing Act. Only 10,943 dwellings were financed under the Act in the first half of 1960 compared with 28,968 dwellings in the same period a year earlier. The total number of dwellings started (at a seasonally adjusted annual rate) was about 100,000 compared with about 144,000 a year earlier and the number of dwellings completed was 140,000 compared with 150,000. In 1958, the record year for housing, dwellings started numbered 165,000.

During the course of the year several steps were taken to stimulate activity in housing. In April funds were made available to the Central Mortgage and Housing Corporation for direct loans and applications were being accepted for the first time since the end of October 1959. In July it was announced that direct loans would be made available to merchant-builders for a limited period of time and income limits for direct loans to individual owners were raised, both measures to become effective at the beginning of September. In October further measures for direct lending were announced and terms and conditions of Central Mortgage and Housing Corporation lending were liberalized.

Business expenditures for plant and equipment in the first half of 1960, at a seasonally adjusted rate of \$5,106,000,000, were about the same as in the same period a year earlier, but somewhat lower than the annual rate for 1959. Evidence of some easing in activity in capital investment during the course of the first six months is to be found in the trend of both imports and domestic shipments of machinery and equipment as well as in the movements in the indicators of non-residential construction. Thus the experience of the first half of 1960 did not confirm the expectations of higher outlays for plant and equipment which had been expressed by business men in the forecast of investment intentions.

Investment in stocks in the first half of 1960 continued to add to the demands on current production. Accumulation of non-farm business inventories amounted to about \$440,000,000 (seasonally adjusted at annual rates) compared with an annual rate of \$355,000,000 in 1959. However, the rate of accumulation fell sharply between the first and second quarters. Continued stock-building in manufacturing industries, in the face of the declining trend in new orders which had set in in the spring, raised the ratio of stocks to shipments at the end of the second quarter to the highest level since early 1958.

The vigorous expansion in economic activity in Western Europe and the sustained level of prosperity in the United States in the first half of 1960 provided a generally favourable climate for Canadian exports. Exports of goods and services were at an annual rate of \$6,952,000,000, about 7 p.c. higher than in the like period of 1959. An 8-p.c. gain in commodity exports reflected conspicuously large gains in sales of aluminum, nickel and copper and substantial losses in sales of farm implements and machinery, wheat,

fishery products and uranium ores and concentrates. The expansion in sales to the United Kingdom and to the countries of the European Common Market was especially large, amounting to 21 p.c. and 28 p.c., respectively; sales to the United States showed only a modest increase.

Imports of goods and services in the first half of 1960 were running at a seasonally adjusted annual rate of \$8,202,000,000, about 4 p.c. higher than in the same period of 1959. The continued growth of payments in service transactions accounted for part of this increase. Commodity imports were higher by 3 p.c.; changes in the main commodity groups were for the most part small and largely offsetting. The slight increase in imports occurred in the first quarter.

The differing rates of increase in exports and imports of goods and services in the first half of 1960 substantially narrowed the deficit on current international account; payments exceeded receipts by \$1,250,000,000 (at a seasonally adjusted annual rate) compared with \$1,386,000,000 in the first half of 1959; the deficit on the merchandise items was \$222,000,000, only half as large as a year earlier.

Going into the second half of the year, merchandise exports showed increased strength and in the eight-month comparison between 1960 and 1959, recording a gain of 9.5 p.c. Merchandise imports also rose in the same comparison but at a much lower rate. Exports exceeded imports in the months of July and August and in the eight-month comparison the import balance was substantially reduced.

INCOME FLOWS

The changes in demand outlined above were reflected in the composition and direction of income flows. National income in the first half of 1960 was only about 2.5 p.c. higher than in the first half of 1959, compared with a gain of 7.5 p.c. in the preceding year-over-year comparison. The flow of income to the business sector was adversely affected, particularly in the second quarter, by the slight easing in industrial production. Thus corporate profits in the first half of the year were moderately lower than a year earlier. Income of unincorporated business (non-farm) was also lower, largely as a result of the drop in activity in the construction industry. The 11-p.c. decline in corporate profits (seasonally adjusted) in the second quarter was one of the sharpest on record and the first set-back in this area since the recovery began in 1958, following two years of steady decline.

Labour income in the first half of 1960 was higher than a year earlier by 4 p.c., with gains in almost all major industries; construction was a significant exception. The largest gain was in forestry, reflecting the distinct improvement in employment in the industry. The service industries continued to record relatively large gains and in trade the rise was also above average. In manufacturing and mining the rise in labour income was comparatively small; employment in mining was off moderately and hours of work in manufacturing were a little below the level of a year earlier.

Personal income in the first half of the year was higher by about 3 p.c. However, direct personal tax collections also rose, leaving income at the disposal of consumers higher by less than 2 p.c. Both personal income and disposable income fell slightly, on a seasonally adjusted basis, in the second quarter, and second quarter disposable income was at virtually the same level as a year earlier.

Despite some unfavourable developments in the flow of income to the business and personal sectors, government revenues were buoyant. Taxes collected by and accruing to government in the first half of 1960 were 10 p.c. higher than in the same period of 1959. At the same time, government expenditures rose much less, so that a large part of the increase in revenue was available to reduce the deficit, which fell from a seasonally adjusted annual rate of about \$800,000,000 in the first half of 1959 to one of about \$440,000,000 in the first half of 1960.

PRODUCTION, EMPLOYMENT AND PRICES

The pattern of production by industry in the first half of 1960 differed considerably from that evident a year earlier. Both the goods-producing industries and the service-producing industries recorded gains in real output of about 2 p.c. but experience varied widely within these broad aggregates. Among the goods-producing industries, output was substantially lower in construction, largely as a consequence of the steep decline in housing, and agricultural output was somewhat lower. The gains in the other goods-producing industries ranged from 3 p.c. in manufacturing to 13 p.c. in public utilities. Some increase in production occurred in all the service-producing industries.

The 5-p.c. gain in mining production reflected fairly sharply opposed movements within the total. Production of fuels rose substantially as a result of the increased output of natural gas and petroleum; quarrying production was down even more sharply in a situation of declining demand for construction materials. Production in the metals and non-metallic groups was moderately higher.

A decided improvement in the market for pulpwood accounted for an 8-p.c. increase in output in the forestry industry.

The 3-p.c. increase in manufacturing production was the outcome of mixed movements in individual manufacturing industries. The major part of the gain was in non-durables; output was higher in most non-durable manufacturing industries, with gains ranging from 1 p.c. and 2 p.c. in foods and textiles to 15 p.c. in chemicals. On the other hand, production declined in the clothing industry and dropped sharply in the less important rubber and leather products industries. Among the durable goods industries, production fell in wood products and in non-metallic mineral products; gains in the other durable goods industries ranged from 1 p.c. in transportation equipment to 10 p.c. in non-ferrous metal products.

The 13-p.c. increase in output of public utilities reflected a further substantial increase in output of electric power and a major gain in the distribution of natural gas.

The lower volume of retail sales in a number of lines, including lumber and building materials, motor vehicles (new and used), hardware, furniture, appliance and radio stores, as well as some others, was only partially offset by gains in sales of food stores and variety stores. However, activity was higher in wholesaling and output for trade as a whole was a little above that of the first half of 1959.

The index of industrial production, which covers mining, manufacturing, and gas and electric utilities, reached its peak of 173.5 (1949 = 100) in January (seasonally adjusted) and tended to decline a little thereafter, standing at 164.1 in July. The declining tendency was most pronounced in the durable segment of manufacturing but was also apparent in mining.

Comparing the first six months of 1960 with the same period a year earlier, employment was higher by about 2 p.c. However, the increase in opportunities of employment did not match the growth in the labour force and unemployment as a percentage of the labour force was 6.6 p.c. compared with 6.1 p.c. in the first half of 1959. The trend of employment in August and September showed somewhat more than seasonal strength. One feature of the labour market in 1960 was the continuing firm demand for labour in the trade and service industries, and hence expanding opportunities for women workers. Thus the year-over-year increase in the number of women employed was substantial, and the increase in the number of employed men was very small.

Prices were somewhat higher in the first half of 1960 than a year earlier. The element of price increase in the gross national expenditure was less than 2 p.c.; all components showed at least some increase in prices. However, much of the advance to a higher level had occurred before the beginning of the year. During the first eight months of 1960, both

the consumer price index and the index of wholesale prices showed only small changes; the same applies to the major components of both indexes. Export prices likewise remained stable, while import prices showed a slight increase in the period.

As this volume went to press, no comprehensive measures of the economy's performance in the third quarter of 1960 were as yet available. However, the indicators pointed to a continuation of the conflicting trends present in the first half of the year, with perhaps more elements of strength than were apparent in the second quarter. Support to the level of the domestic economy continued to come from the external sector as exports maintained their substantial year-over-year gains and imports fell off moderately. In a situation of easier conditions in mortgage markets, housing began to show signs of recovery when seasonal factors were taken into account. At the same time, preliminary indications were that investment in business inventories was slackening. Some improvement was indicated in retail sales and small gains were also reflected in the trends of production and employment.

While there was uncertainty in many quarters about the strength of housing demand, the evidence available showed a distinct pick-up in housing activity in the autumn months. When seasonal factors were taken into account, housing starts (in municipalities of 5,000 or more population) in October were running at an annual rate of 89,000 units, 20 p.c. higher than in the third quarter and 33 p.c. higher than in the low second quarter. The lending activity of the life, loan and trust companies under the National Housing Act rose during the course of the year and in September these lenders approved loans for over five times as many dwelling units as in the preceding September when their lending activity was exceptionally low; applications in the hands of these companies suggested further expansion. On the other hand, lending activity of the chartered banks and the Central Mortgage and Housing Corporation remained much below the levels of 1959; the number of loan approvals in September was only about half as large as a year earlier.

Nine-month data on commodity exports showed a gain over the comparable period of 1959 of 8 p.c., all of which was in exports to countries other than the United States. At the same time commodity imports were only fractionally higher, resulting in a deficit on merchandise account of about \$121,000,000 compared with \$415,000,000 in the same period of 1959.

Preliminary statistics for the month of August indicated a pick-up in manufacturers' shipments (seasonally adjusted). In this situation, the building up of manufacturers' inventories, which had been in progress since late 1958, appeared to have been arrested if not reversed. The index of industrial production rose slightly in August to reach 165.4 (seasonally adjusted), reflecting a rise in the output of durable manufactures, following the sharp drop in the previous month, and a further expansion in the output of the utilities. Non-durable manufacturing output remained virtually stable and mining production continued to decline. Most of the durable groups showed some increase.

The value of retail sales rose a little in September, on a seasonally adjusted basis. Some of the gain was in sales by motor vehicle dealers but department stores and the furniture, radio and appliance group recorded somewhat lower sales.

Evidence of some improvement in economic activity was present in employment statistics for October, the decline in employment between September and October being less than seasonal. At the same time, the labour force expanded more rapidly than it had for the two preceding years, with the result that the number unemployed rose more than seasonally.

SYMBOLS

The interpretation of the symbols used in the tables throughout this publication is as follows:—

.. figures not available.

... figures not appropriate or not applicable.

— nil or zero.

- - amount too small to be expressed or where "a trace" is meant.

PART I.—GEOGRAPHY*

Canada occupies the northern half of the North American Continent with the exception of Alaska and Greenland, extending in longitude from Cape Spear, Newfoundland, at 52° 37' W, to Mount St. Elias, Yukon Territory, at 141° W, a distance of 88° 23'. In latitude it stretches from Middle Island in Lake Erie, at 41° 41' N, to the North Pole. The northernmost point of land is Cape Columbia on Ellesmere Island, at 83° 07' N. Canada is thus a western and a northern country, a fact of increasing strategic significance.

In shape, Canada resembles a distorted parallelogram with its four corners making important salients. In the north the salient formed by the Arctic Archipelago, which penetrates deep into the Arctic basin, guards the northern approaches to the Continent from Europe and Asia and makes Canada neighbour to the Union of Soviet Socialist Republics. In the south the salient of peninsular Ontario thrusts far into the heart of the United States. In the east the salient of Labrador and the Island of Newfoundland commands the shortest crossings of the North Atlantic Ocean and links Canada geographically with the United Kingdom and France. In the west the broad arc of land between Vancouver in southern British Columbia and Whitehorse in Yukon Territory provides the shortest crossings of the North Pacific Ocean between continental North America and the Far East. Canada thus lies at the crossroads of contact with the principal powers and some of the most populous areas of the world.

* Revised by the Geographical Branch, Department of Mines and Technical Surveys, Ottawa.

In size, Canada is the largest country in the Western Hemisphere and the second largest country in the world. Its area of 3,851,809 sq. miles may be compared with that of the Union of Soviet Socialist Republics, 8,649,821 sq. miles,* the United States of America (including Alaska and Hawaii), 3,615,213 sq. miles,* and Brazil, 3,287,204 sq. miles.* It is more than forty times the size of the United Kingdom and eighteen times that of France. The immense size of the country, while encompassing many resources and seeming to afford much scope for settlement, imposes its own burdens and limitations, particularly because much of the land is mountainous and rocky or is under an Arctic climate. The developed portion is probably not more than one-third of the total; the occupied farm land is less than 8 p.c. and the currently accessible productive forested land 19 p.c. of the total. The population of Canada, estimated at 17,442,000 on June 1, 1959, may be compared with 174,809,000† for the United States (including Alaska and Hawaii) (1958) and with 62,725,000† for Brazil (1958).

1.—Approximate Land and Freshwater Areas, by Province or Territory

NOTE.—A classification of land areas as agricultural, forested, etc., is given at p. 20.

Province or Territory	Land	Freshwater	Total	Percentage of Total Area
	sq. miles	sq. miles	sq. miles

Section 1.—Physical Geography

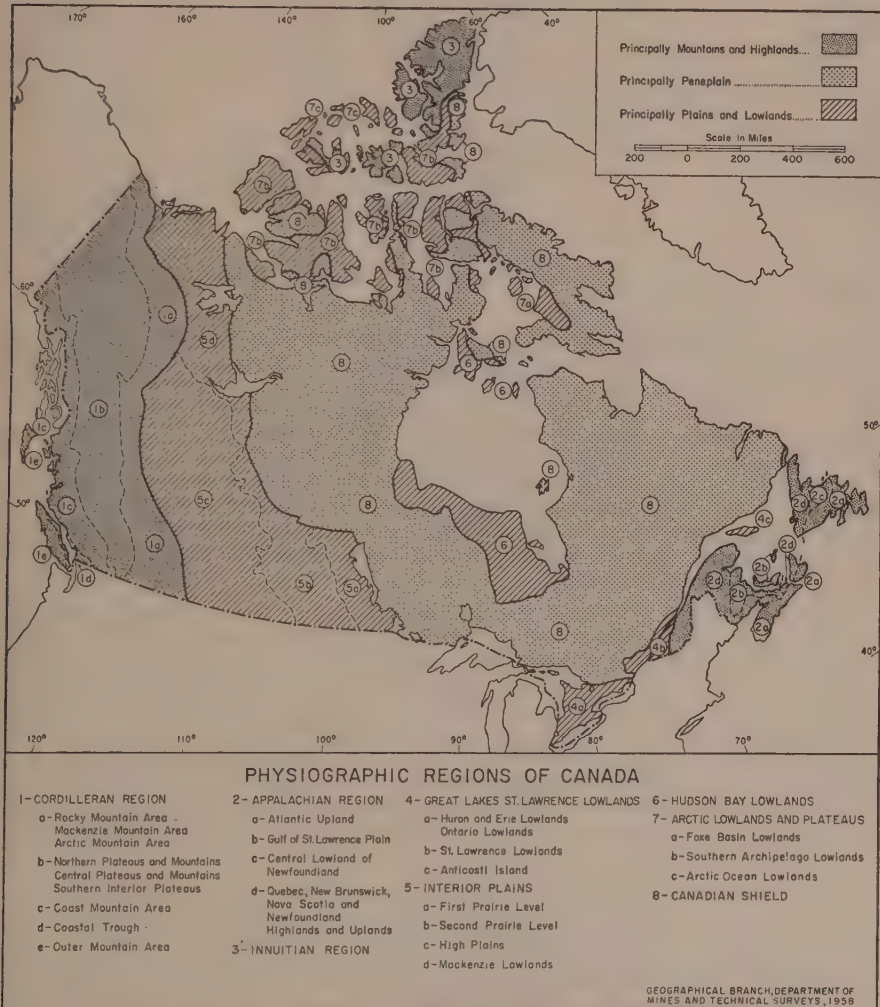

Subsection 1.—Physiographic Regions

Canada includes each of the major characteristic structures of the North American Continent with the exception of the Atlantic coastal plain. Structure tends to dominate relief to a remarkable degree even though its effects have been modified by glacial and river erosion or deposition. Consequently, structural regions have become the main physiographic divisions.

* United Nations Statistical Yearbook, 1958.

† United Nations Population and Vital Statistics Report, Oct. 1, 1959.

Eight physiographic regions dominate the country: (1) the Cordilleran Region; (2) the Appalachian Region; (3) the Innuitian Region; (4) the Great Lakes St. Lawrence Lowlands; (5) the Interior Plains; (6) the Hudson Bay Lowlands; (7) the Arctic Lowlands and Plateaus (under slightly different nomenclature) are given in the 1957-58 Year Book at pp. 3-9. The physical structure of the country is also described in its relation to climatic phenomena in a special article on The Climate of Canada which appears in the 1959 Year Book at pp. 23-51.

Subsection 2.—Inland Waters

The inland waters of Canada (not including saltwater areas that are a part of Canada) are extensive, constituting over 7.6 p.c. of the total area of the country. They are best studied by segregating the main drainage basins as shown in Table 2.

2.—Drainage Basins

Drainage Basin and Province or Territory	Area Drained ¹	Drainage Basin and Province or Territory	Area Drained ¹
	sq. miles		sq. miles
Atlantic Basin	695,370	Arctic Basin (mainland)	944,280

Alberta.....	86,530	Alberta.....	2,540
Northwest Territories.....	181,450	Saskatchewan.....	6,060

¹ Areas are approximate and are exclusive of those portions of the basins of all rivers that lie in United States territory, and of areas of interior drainage.

During the early period of exploration and development the waterways of Canada were the sole means of access to and travel in the interior. This function is still of importance to much of the country, particularly in the north where most traffic moves by water or by air. In the settled areas, however, the construction of roads and railways has reduced the role of the waterways as transportation routes but they have assumed other functions. Some, particularly in the Canadian Shield area and the Cordilleran region, have been harnessed for the production of electric power. Others, mainly in southern Alberta and Saskatchewan, have been dammed to provide water for irrigation purposes. In Eastern Canada many of the rivers have been controlled in an over-all program of flood prevention and conservation of renewable resources or to provide dependable supplies of water for industrial and domestic purposes.

In Eastern Canada, the Great Lakes and St. Lawrence drainage system dominates all others and forms an unequalled navigable inland waterway through an extensive region rich in natural and industrial resources. From Duluth, Minn., at the head of Lake Superior to Belle Isle at the entrance to the Gulf of St. Lawrence the distance is 2,280 miles. The St. Lawrence waterway and its tributaries, most of which have lakes available for reservoiring, have very large developed and potential power resources. In 1959 an event of great international importance took place with the opening of the St. Lawrence deep waterway (Seaway), providing a navigation channel with a minimum depth of 27 feet from Montreal to the Great Lakes. Navigation of ocean-going ships is now possible into the heart of the Continent, and it is anticipated that the whole Great Lakes area will undergo many changes as a result.

The greater part of Canada drains into Hudson Bay and the Arctic Ocean; the Nelson River drainage is exceptional in running *through* the most arable and the most settled part of Western Canada but otherwise the rivers of the west, east of the Rockies, run *away* from the settled areas towards the cold northern salt waters and this adversely affects their industrial utility. The Mackenzie River, which drains Great Slave Lake, is, with its headwaters, the longest river in Canada (2,635 miles) and its valley constitutes the natural transportation route through the Northwest Territories to the Arctic Ocean. From Fort Smith on the Slave River large river boats run without any obstruction to Aklavik on the delta of the Mackenzie, a distance of 1,292 miles. Table 3 gives the lengths of the principal rivers with their tributaries, classified according to the four major drainage basins.

3.—Lengths of Principal Rivers and Their Tributaries

Note.—In this table the tributaries and sub-tributaries are indicated by indentation of the names. Thus the Ottawa and other rivers are shown as tributary to the St. Lawrence, and the Gatineau and other rivers as tributary to the Ottawa.

Drainage Basin and River	Length miles	Drainage Basin and River	Length miles

The outstanding lakes of Canada are the Great Lakes, though only parts of these are in Canadian territory. The International Boundary between Canada and the United States passes through Lakes Superior, Huron, St. Clair, Erie and Ontario. Details are given in Table 4.

4.—Elevations, Areas and Depths of the Great Lakes

Lake	Elevation Above Sea Level	Length	Breadth	Maximum Depth	Total Area	Area on Canadian Side of Boundary
	ft.	miles	miles	ft.	sq. miles	sq. miles
Superior.....	602.23	383	160	1,302	31,820	11,200
Michigan (U.S.A.).....	580.77	321	118	923	22,400	—
Huron.....	580.77	247	101	750	23,010	13,675
St. Clair.....	575.30	26	24	23	460	270
Erie.....	572.40	241	57	210	9,940	5,094
Ontario.....	245.88	193	53	774	7,540	3,727

There are no tides in the Great Lakes although considerable variation in water levels is occasioned by strong winds.

Other large lakes of Canada, ranging in area from 9,000 to 12,000 sq. miles, are Lake Winnipeg, Great Slave Lake and Great Bear Lake. Apart from these, notable for size, are innumerable lakes scattered over that major portion of Canada lying within the Canadian Shield. In an area of 6,094 sq. miles, accurately mapped, south and east of Lake Winnipeg, there are 3,000 lakes. In an area of 5,294 sq. miles, accurately mapped, southwest of Reindeer Lake in Saskatchewan, there are 7,500 lakes.

5.—Elevations and Areas of Principal Lakes, by Province

NOTE.—Areas given are for mean water levels. For those reservoirs and lakes for which two elevations are given, HW means high water, LW low water, and N normal level.

Subsection 3.—Coastal Waters

The coastline of Canada, one of the longest of any country in the world, comprises the following estimated milages:—

Mainland—

Atlantic, 6,110; Pacific, 1,580; Hudson Strait, 1,245; Hudson Bay, 3,155; Arctic, 5,770; total, 17,860 miles.

Islands—

Atlantic, 8,680; Pacific, 3,980; Hudson Strait, 60; Hudson Bay, 2,305; Arctic, 26,785; total, 41,810 miles.

A comprehensive description of the coastal waters of Canada would require information from sciences such as oceanography, marine biology and meteorology. However, the basic factor in any study of the oceanic-continental margin is the physical relief of the sea floor and the scope of the information presented here is therefore restricted to this and a few salient features of the Atlantic, Arctic and Pacific marginal seas surrounding Canada. Further details are given in the 1947 Year Book, pp. 3-12.

Atlantic.—Along this coastal area, the sea has inundated valleys and lower parts of the Appalachian Mountains as well as those of the Canadian Shield. The submerged Continental Shelf, protruding seaward from the shore, effects the transition from continental to oceanic conditions. This Shelf is distinguished by great width and diversity of relief. From the coast of Nova Scotia its width varies from 60 to 100 miles, from Newfoundland 120 to 50 miles (at the entrance of Hudson Strait), and northward it merges with that of the Arctic Ocean. The outer edge of the Shelf, known as the Continental Shoulder, is of varying depths of from 100 to 200 fathoms before the Shelf suddenly gives way to the steep declivity leading to abyssal depths. The over-all gradient of the Atlantic Continental Shelf is slight but the whole area is studded with shoals, plateaus, banks, ridges and islands and the coasts of Nova Scotia and Newfoundland are rugged and fringed with islets and shoals. Off Nova Scotia the 40-fathom line lies at an average of 12 miles from the shore and constitutes the danger line for coastal shipping. The whole floor of the marginal sea appears to be traversed by channels and gullies cutting well into the Shelf.

The main topographical features of the Atlantic marginal sea floor are attributed to glacial origin but land erosion is an important factor. Eroded materials are carried seaward by rivers, ice and wind, and wave action against cliffs and shore banks washes away enormous masses that are deposited over the surrounding sea floor. The topography of the continental sea floor is therefore constantly changing and navigation charts of Canada's eastern seaboard must be continuously revised.

Arctic.—The submerged plateau protruding from the northern coast of North America is a major part of the Great Continental (or Polar) Shelf surrounding the Arctic Ocean on which lie all the Arctic islands of Canada, Iceland, Greenland and most of those of Europe and Asia. This Shelf develops its maximum width on the 80th meridian of west longitude where it extends from the south of James Bay to the north coast of Ellesmere Island, a distance of over 2,000 miles.

The floor topography of this continental margin is largely unexplored but sufficient has been charted to indicate an abrupt break at the northern oceanward edge. This steep continental terrace borders the whole western side of the Canadian Archipelago and constitutes one of the most striking and significant features of the Polar regions. From this declivity, deep well-developed troughs cut by glaciers enter between the western group of islands. A ridge across Davis Strait on which the depth is about 200 fathoms separates this basin from the open Atlantic.

Hudson Bay and Hudson Strait bite deeply into the Continent. Hudson Bay is an inland sea 250,000 sq. miles in area having an average depth of about 70 fathoms; the greatest charted depth in the centre of the Bay is 141 fathoms.

Hudson Strait separates Baffin Island from the continental coast and connects Hudson Bay with the Atlantic Ocean. It is 430 miles long and from 37 to 120 miles wide and its greatest charted depth of 481 fathoms is close inside the Atlantic entrance. Great irregularities of the sea floor are indicated but, except in inshore waters, few navigation hazards have been located.

That part of the Continental Shelf bordering the Arctic Ocean at the northwest edge of the Queen Elizabeth Islands is to be the subject of extensive study. In 1959 a party based at the joint Canadian-United States weather station at Isachsen on Ellef Ringnes Island made a reconnaissance survey of the oceanography, hydrography, submarine geology, gravity and magnetic features of the Shelf area, together with physiographic, hydrological and glaciological studies of the adjacent and intervening islands. These studies were carried out in preparation for an intensive program of survey and research to be started in 1960, which should ultimately yield detailed and accurate information on the physical and chemical composition and dynamic characteristics of the Arctic oceanic waters; the extent, topography and structure of the Shelf and the nature of its sediments, its underlying rocks and its possible mineral resources; the factors controlling the development of the Arctic landscape and the evolution of the islands; the behaviour of sea level, glaciers, sea ice and climate in the recent geological past. Detailed studies will be carried out first on that part of the Continental Shelf lying out to sea from, and between, Meighen Island and Borden Island, with a reconnaissance to the southwest. The work will continue until all of the Canadian sector of the Polar Continental Shelf has been investigated.

Pacific.—The marginal sea of the Pacific differs strikingly from the other marine zones of Canada. The hydrography of British Columbia is characterized by bold, abrupt relief—a repetition of the mountainous landscape. Numerous inlets penetrate the mountainous coast for distances of 50 to 75 miles. They are usually a mile or two in width and of considerable depth, with steep canyon-like sides. From the islet-strewn coast, the Continental Shelf extends from 50 to 100 sea miles to its oceanward limit where depths of about 200 fathoms are found. There the sea floor drops rapidly to the Pacific Deep, parts of the western slopes of Vancouver Island and the Queen Charlotte Islands lying only four miles and one mile, respectively, from the edge of the declivity. These great detached land masses are the dominant features of the Pacific marginal sea. As is to be expected in a region so irregular in hydrographic relief, shoals and pinnacle rocks are numerous, necessitating cautious navigation. A grave menace to coastal shipping plying

the Seymour Narrows between Vancouver Island and the mainland was eliminated on Apr. 5, 1958 when the twin peaks were blasted off Ripple Rock in one of the largest non-atomic explosions created by man. The peaks had reached to within 9 feet and 21 feet of the surface during low water, and had been responsible for the sinking and damaging of some 114 vessels during the preceding 80 years. Their presence caused treacherous disturbances and whirlpools to form as the ocean tides rushed through the Narrows, and only the most highly powered vessel would attempt to navigate the channel during any period other than the 20 to 40 minutes of slack water between tides. The blast increased the clearance to 47 feet and 69 feet at low water and the channel is now navigable at all times.

Subsection 4.—Islands

The largest islands of Canada are in the north and all experience an Arctic climate. The northern group extends from the islands in James Bay to Ellesmere Island which reaches 83°07'N. Those in the District of Franklin lie north of the mainland of Canada and are generally referred to as the Canadian Arctic Archipelago; those in the extreme north—lying north of the M'Clure Strait—Viscount Melville Sound—Barrow Strait—Lancaster Sound water passage—are known as the Queen Elizabeth Islands.

On the West Coast, Vancouver Island and the Queen Charlotte Islands are the largest and the most important but the coastal waters are studded with many small rocky islands.

The Island of Newfoundland forming part of the Province of Newfoundland, the Province of Prince Edward Island, Cape Breton Island forming part of the Province of Nova Scotia, Grand Manan and Campobello Islands forming part of the Province of New Brunswick, and Anticosti Island and the Magdalen group included in the Province of Quebec are the chief islands off the East Coast.

Notable islands of the inland waters include Manitoulin Island (1,068 sq. miles in area) lying in Lake Huron, the so-called Thirty Thousand Islands of Georgian Bay and the Thousand Islands in the outlet from Lake Ontario into the St. Lawrence River.

Subsection 5.—Mountains and Other Heights

The predominant geographical feature in Canada is the Great Cordilleran Mountain System which contains many peaks over 10,000 feet in height. The highest peak in Canada is Mount Logan in the St. Elias Mountains of Yukon Territory, which rises 19,850 feet above sea level. The highest elevations in all parts of the country are shown in Table 7 in feet above mean sea level.

7.—Principal Heights in each Province and Territory

Note.—Certain peaks, indicated by an asterisk (*), form part of the line of demarcation between political subdivisions. Although their bases technically form part of both areas, they are listed only under one to avoid duplication.

Section 2.—Physical and Economic Features of the Provinces and Territories

Politically, Canada is divided into ten provinces and two territories. Each of the provinces is sovereign in its own sphere, as set out in the British North America Act of 1867 and its amendments, and as new provinces have been organized (see p. 83) they have been granted political status equivalent to that of the original provinces. The Yukon and Northwest Territories are administered by the Federal Government, although they are gaining an increasing voice in their affairs through elected representatives in the House of Commons, through elected representatives on the Territorial Councils, and through municipal and other local organizations. The main physical and economic features of each of the provinces and of the territories are described briefly in the 1956 Year Book at pp. 12-17. The physical characteristics of the provinces and territories are also covered very adequately in their relation to climate in the special article on The Climate of Canada which appears in the 1959 edition at pp. 23-51. Details of resources and their development are given in later chapters of this volume.

PART II.—GEOLOGY

As stated on p. 2 in the Subsection on Physiographic Regions, the geological structure of the country dominates its relief and therefore the geological divisions and the physiographic regions, shown on the map on p. 3, generally coincide.

Over half of Canada consists of the Precambrian Canadian Shield that forms the central rocky upland which contains most of Canada's mineral resources, except for fossil fuels. The Shield is flanked by younger sedimentary rocks that contain, or may contain, reserves of petroleum, natural gas or coal, or all three. These form the units known as the Great Lakes St. Lawrence Lowlands, the Hudson Bay Lowlands, the Interior Plains and the Arctic Lowlands and Plateaus. On the east, the St. Lawrence Lowlands are flanked by the Appalachians of the Maritimes, Gaspé and Newfoundland where fossil fuels are found in sedimentary strata and metallic minerals occur in the rocks associated with igneous intrusions. The Cordilleran region of the western mountains, adjacent to the Interior Plains, is younger than the Appalachians but is the source of similar mineral deposits. Finally, the Inuitian region of Arctic mountains, in the Arctic Archipelago, probably also contains mineral deposits of many kinds though relatively little is as yet known of the potential.

A detailed treatment of the geology of Canada is given in the 1951 Year Book, pp. 14-26, although this account is somewhat outmoded by information secured in the intervening years. A later account is available in *Geology and Economic Minerals of Canada*, 4th edition (517 pp.) published in 1957 by the Geological Survey of Canada.*

THE GEOLOGICAL SURVEY OF CANADA†

The Geological Survey of Canada is, so far as is known, the oldest scientific organization in the Government of Canada. When the first United Parliament of Upper and Lower Canada met in July 1841 it considered a petition to carry out a geological survey, and on Sept. 10 of that year resolved "that a sum of money not exceeding one thousand five hundred pounds sterling, be granted to Her Majesty to defray the probable expense in causing a Geological Survey of the Province of Canada". William Logan was appointed geologist in the spring of 1842 and since then the Geological Survey of Canada has been in continuous operation. It is one of the oldest Geological Surveys in the world, that of the United Kingdom having been established in 1835 and that of the United States in 1879. Geological investigations had been carried out in Lower Canada and on the Island of Newfoundland before 1842 but these were local and sporadic.

Logan remained Director of the Survey until 1869 and following his retirement a younger man took over the direction of the mapping of the enormous expanse that Canada had become in 1867. The Survey expanded considerably in the next twenty years, and its officers explored, mapped and made scientific studies over much of the new land. For example, until the early 1950's virtually the only information available on the District of Keewatin in the Northwest Territories was that collected and compiled by J. B. Tyrrell in the 1890's. During this period of exploration the geologists acted as geographers, topographers, biologists and ethnologists and collected data on water power, forestry and agricultural possibilities. Many of the officers of that time have become national figures and their reports provide some of the most interesting accounts of the early systematic exploration of Canada. Among the better known names, besides that of Tyrrell who joined the Survey in 1871 and died in his 99th year in 1957, are Dawson and McConnell who explored much of the western mountains; Low, famous for his explorations in the Labrador peninsula; Faribault, who mapped Nova Scotia; and the Bells, Robert and McIntosh, who between them explored much of the Canadian North.

* Obtainable from the Queen's Printer or from the Geological Survey of Canada, Ottawa.

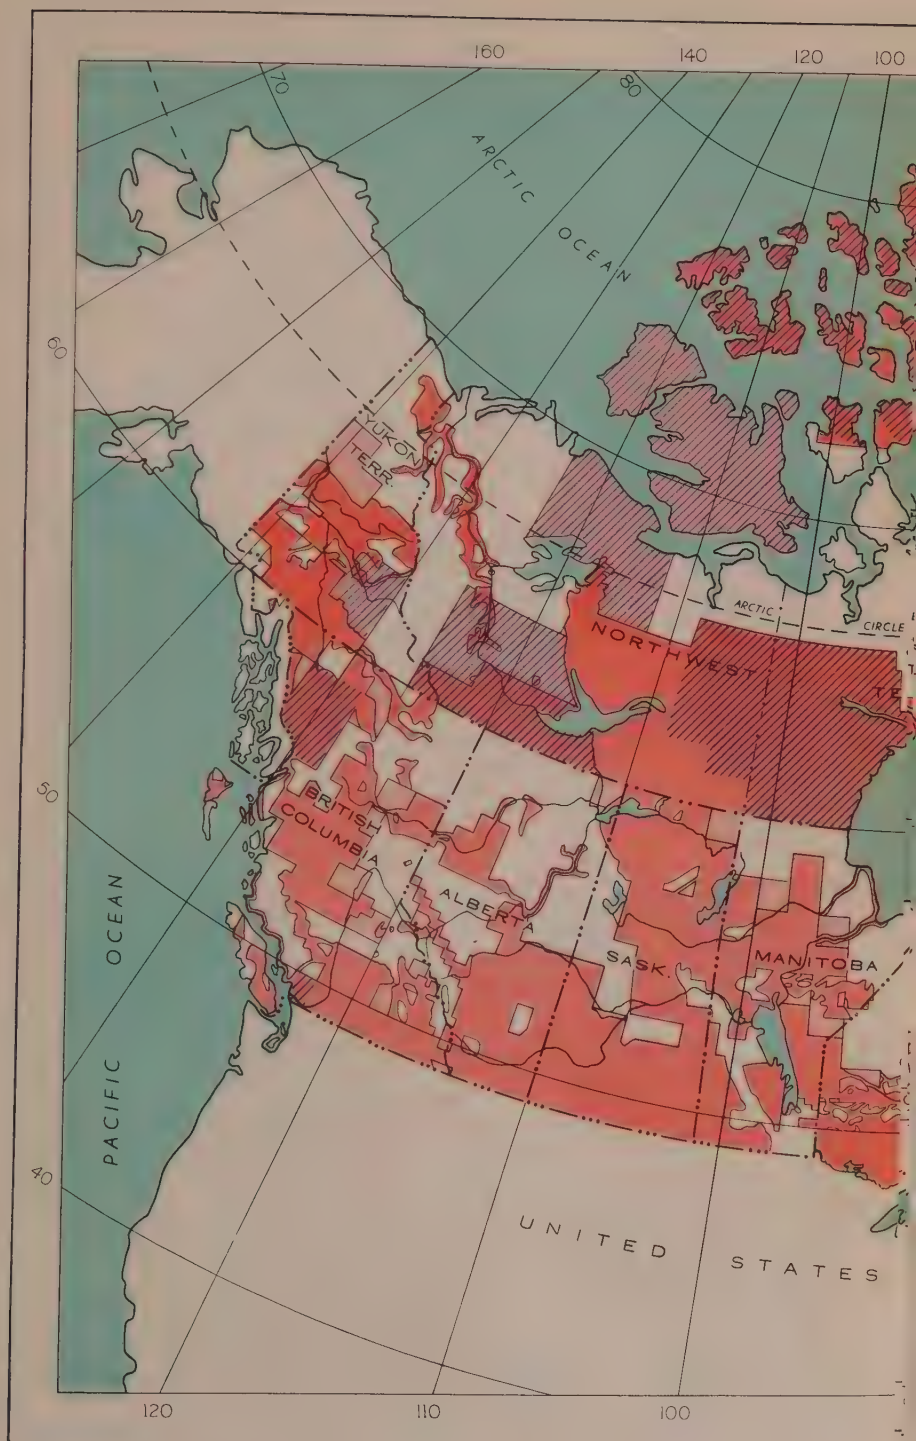

† Prepared by Dr. J. M. Harrison, Director, Geological Survey of Canada, Department of Mines and Technical Surveys, Ottawa.

About the turn of the century, mining began to assume an important role in the economy of the country. The far northern parts of Canada were generally inaccessible for mining, and geological work was therefore directed to detailed studies that would be of more immediate assistance to the development of a mining industry. About this time, too, the Ontario and Quebec Departments of Mines began geological studies. These are still expanding as are several other provincial organizations that came into being in the 1930's and 1940's. The turn of the century also saw increasing specializations, so that topographers, land surveyors, ethnologists and biologists were engaged, thus freeing geologists of all duties except their specialities. Today the Geological Survey of Canada is concerned only with geological studies.

In the first hundred years the Geological Survey was almost solely concerned with mapping but, immediately following World War II, laboratory investigations became of increasing importance and no doubt will become still more important. Nevertheless, the first priority of the Survey is to complete as soon as possible the reconnaissance geological mapping of Canada, an area of more than 3,800,000 sq. miles, of which only slightly more than half has so far been examined. Reconnaissance, or exploratory, mapping results in maps published on a scale of one inch to eight miles or four miles. Selected parts of such map-areas are then studied on a scale of one inch to one mile in those regions where the geological conditions appear economically worthwhile. Later, where important mineral deposits are known or important scientific data may be obtained, smaller areas are mapped on a scale of one inch to 1,000 feet, or even 200 feet. The Survey is essentially the only organization that undertakes mapping on reconnaissance scales, although some provincial governments have done so and certain mining exploration companies do so for their own information in geologically unmapped areas.

Geological maps are the basic tool for all geological investigations, for they provide the fundamental data on which all the studies depend. However, the immediate economic use of areal geological maps prepared by the Geological Survey of Canada and the provincial geological surveys is to guide prospectors by indicating the extension of rocks or structures already known to contain valuable mineral deposits. They are also the only means of evaluating the potential resources of unprospected areas which in the future may become accessible by railway or road, and they provide engineering data in rapidly expanding metropolitan areas. In many instances, however, no immediate economic use of a map may be foreseen because the area is inaccessible and because no valuable mineral deposits are known in it. But inaccessibility is relative, and as transportation improves even the most remote areas become of interest to the prospector. Demands for minerals also change and a mineral that is valueless today may be eagerly sought tomorrow. Thus, a geological map for many years may be of scientific interest only and then suddenly become of paramount economic interest. A recent example was the geological map of the Blind River area of Ontario, published by the Geological Survey in 1925. At that time uranium was not considered a valuable mineral nor was it known to occur in this area but almost thirty years later, in 1952, astute application of geological theory led to the realization that a particular rock unit shown on this map might hold deposits of uranium. The result was extensive staking of mining claims guided by this old map, and by 1955 a major new mining camp was established which now has the largest proved reserve of uranium ore in the world and which, in 1959, produced uranium precipitates valued at an estimated \$242,000,000. The Blind River map demonstrates that geological maps should be available in advance of demand. Geological mapping, if started after a major mineral discovery, cannot keep pace with needs, and large sums may be wasted through inefficient planning, prospecting and exploration.

Up to 1952, after 110 years of mapping, only about 1,000,000 sq. miles or slightly more than one-quarter of the land area of Canada had been geologically mapped on any scale whatsoever, and much of this mapping was not up to modern standards since it dated back to the old exploration surveys that were confined to navigable streams, shorelines of lakes, and mountain trails. Systematic mapping had gained considerable impetus in the 1930's

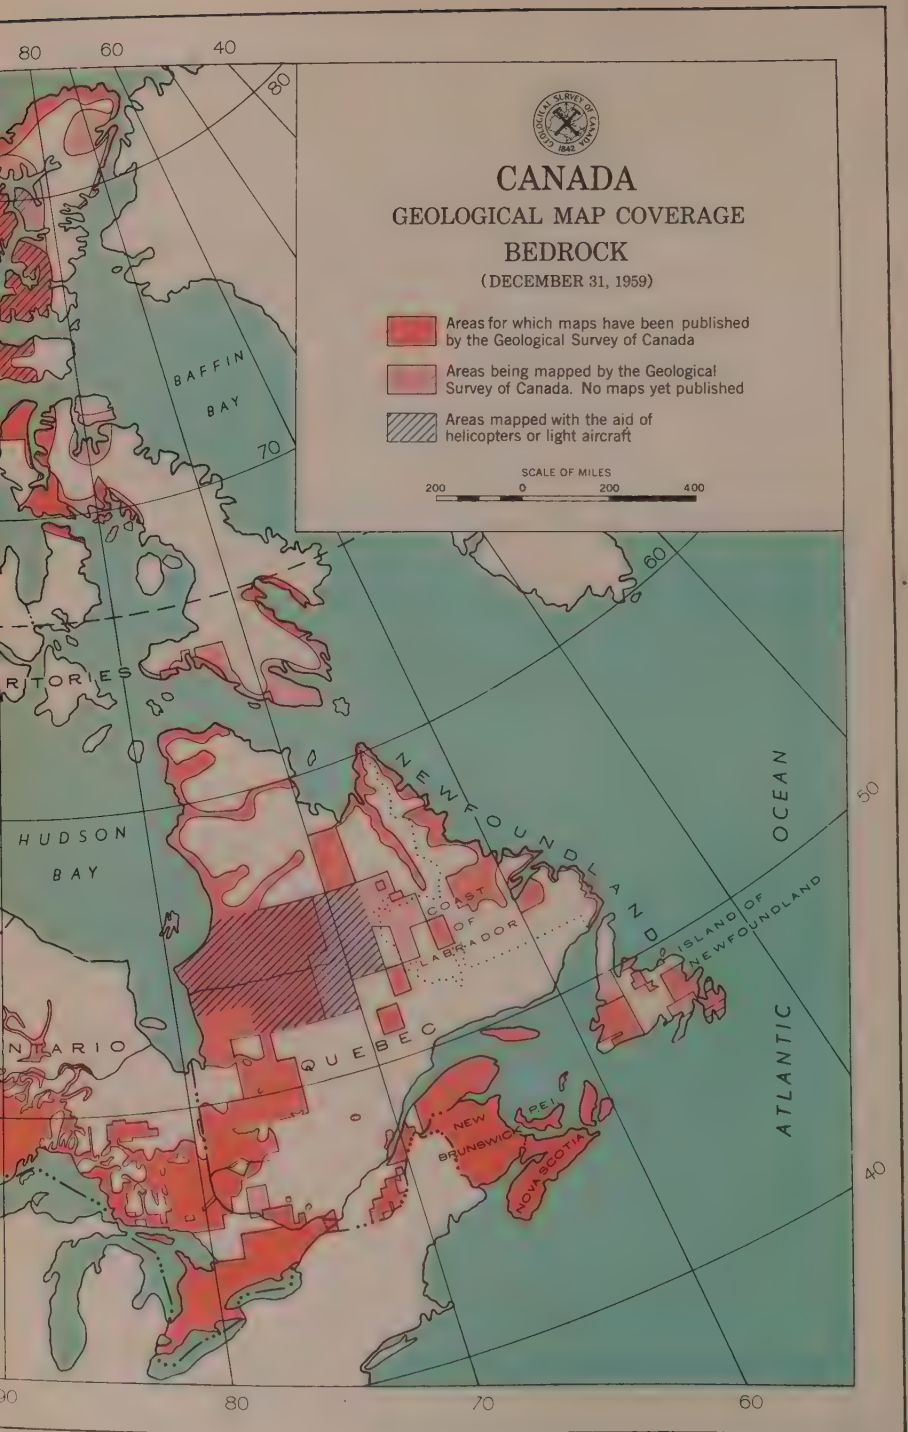

Figure 1.

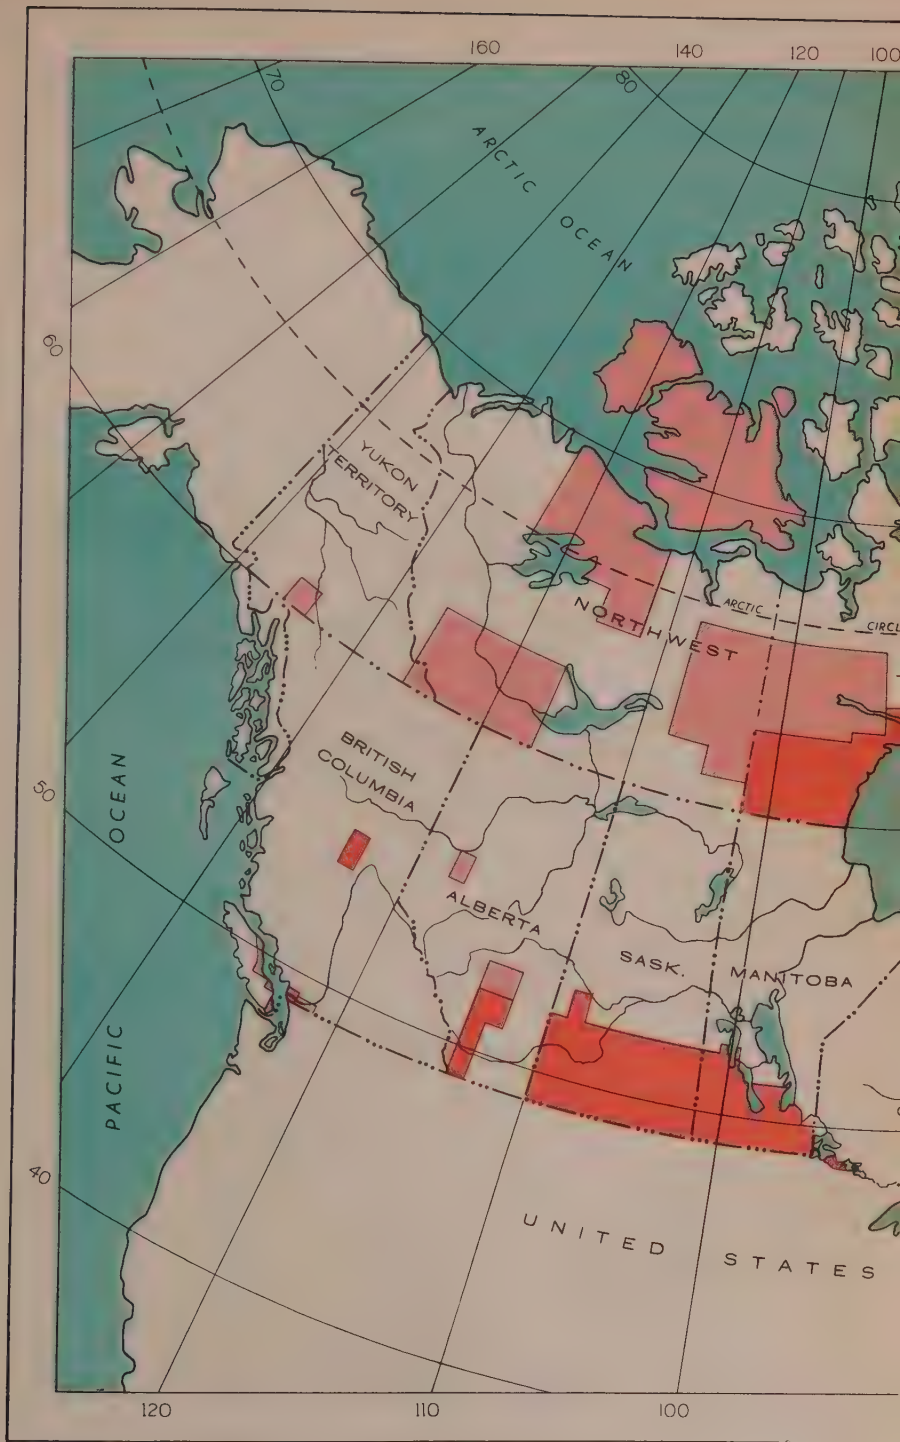

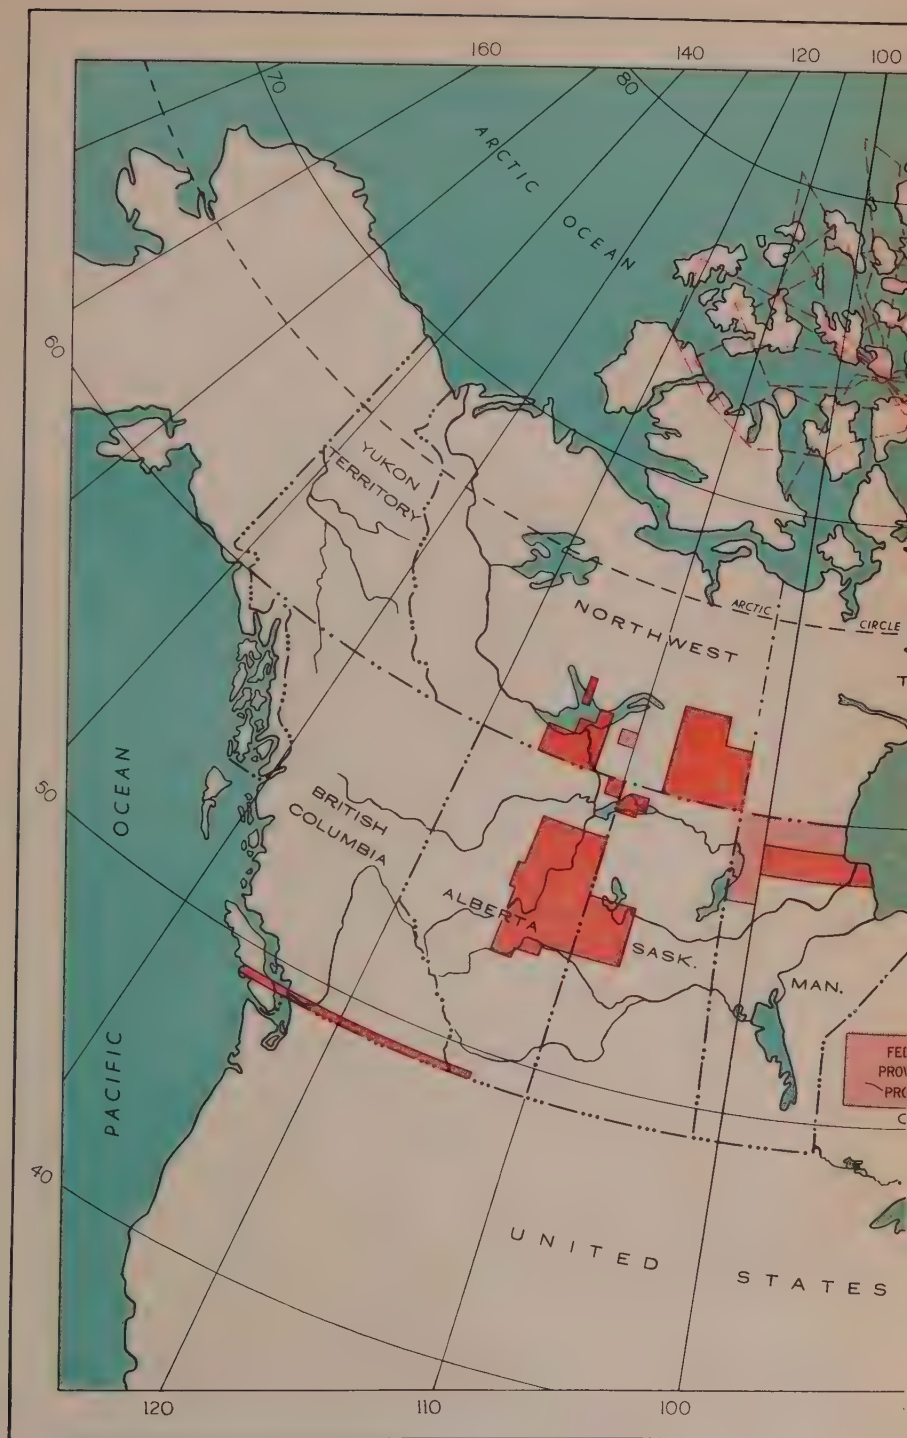

Figure 2.

with the use of "bush" aircraft but, even so, the area a reconnaissance party could investigate in one season was discouragingly small compared with the area still to be mapped. In 1952, however, the Geological Survey tried using helicopters for reconnaissance geology in the barren lands west from Hudson Bay and the experiment was a complete success. Five geologists mapped in one season an area that would have taken them about 25 years to map by previous methods, and at a lower cost per square mile. From 1952 to 1959 helicopter parties mapped about 625,000 sq. miles, including areas in northern British Columbia, Yukon Territory, the Mackenzie River basin, the Arctic islands, the Canadian Shield of the Northwest Territories and New Quebec, and Nova Scotia (Fig. 1). As a result of data made available from such helicopter reconnaissance by the Geological Survey in 1955, several oil companies have contracted to spend large sums of money on the search for oil in the Arctic islands. In 1958 and 1959 an experiment in aerial reconnaissance in the Western Arctic was carried out by field parties using Super-Cub aircraft fitted with oversize tires which enabled geologists to be landed in unprepared localities where rock outcrops merited examination; about 125,000 sq. miles were thus mapped in the two seasons of reconnaissance. Altogether, therefore, the Geological Survey has mapped nearly as much of Canada in the past eight years as had been mapped in the previous 110 years (Fig. 1). It now appears that the initial geological reconnaissance mapping of Canada will be completed in the next ten or twelve years, and even though this mapping is intended as a preliminary to detailed studies of the more promising areas, its immediate value has been clearly shown.

Besides field studies of the bedrock geology, the Survey is investigating the character of the great volume of unconsolidated material left behind as the Pleistocene ice-sheets retreated northwards. Only in recent years have systematic studies been possible and very little is known about the surficial geology of great areas in Canada (Fig. 2). These studies are not only of great scientific importance but also have much economic significance. The understanding of soil needs for agriculture and forestry and correct planning for land utilization depend to a large extent on knowledge of these Pleistocene strata. The deposits of sand and gravel that form part of the Pleistocene material are widely used in engineering works of all kinds, and some of them hold important quantities of underground water.

The prairies are depending more and more on sources of underground water for industrial, domestic and agricultural use, and the distribution of this underground water depends on the distribution of various kinds of rocks and unconsolidated materials in the area. Thus, usable water is confined to porous strata that allow the water to flow through them and these strata may accumulate large quantities of water from the rainfall of a vast area. It is to such underground water that the oases in the desert regions owe their existence, and it is on such water that the development of the Canadian prairies will increasingly depend. The Geological Survey is actively engaged in making studies of groundwater potentials in several regions of Canada, but systematic studies began only recently and a tremendous amount of work must still be done before even a first assessment of the potential supply can be made.

Reconnaissance geological mapping serves mainly to show where more detailed studies are required in order to understand the basic geological problems and provide specific data in the search for minerals, fuels and underground waters. The Geological Survey, therefore, has a considerable portion of its staff engaged on such detailed studies. These include detailed mapping in a mining area in Manitoba, special studies of sub-surface geology related to petroleum and natural gas in the western plains and Eastern Canada, engineering geology for the St. Lawrence Seaway and in the selection of hydro-electric dam sites in Yukon Territory, investigations on underground supplies of water in British Columbia and Saskatchewan, and detailed studies of the unconsolidated glacial deposits in Alberta and Ontario. Thus is exemplified the diversity of field geology.

FIELD GEOLOGY

◀ Investigating a sheer drop in the rugged interior of British Columbia.

▶ Geologist examining an outcrop with a quartz vein in the Yellowknife area of the Northwest Territories.

▶ An Arctic campsite—here, as in all remote and otherwise inaccessible areas the helicopter is essential as a transport vehicle.

Geological findings are plotted on maps at field camps.

◀ Typical Canadian Shield country—much of which is now undergoing initial geological reconnaissance mapping.

Although field mapping is vital to geology, answers to many problems can be found only by laboratory investigation. In the past few years much more adequate facilities have become available for such investigations. The new Geological Survey building in Ottawa, which was occupied in 1959, contains laboratories designed for many kinds of study, and research already under way and planned for the future will help greatly in extending the science of geology. Most of the problems studied are those that result from field mapping. For example, it is important to know the age of the rocks relative to each other, and in areas where rocks contain fossils the palaeontologist can provide such information. About half of Canada is underlain by such rocks, including those parts where petroleum and coal are likely to be found. Certain animals and plants lived only at specific times and their fossils can therefore be used to date the rocks. One of the first reports of the Geological Survey was based on knowledge of palaeontology and was concerned with the possibilities of finding coal in Upper Canada (southwestern Ontario). Logan pointed out that the fossils in the youngest rocks in the region were much older than those of the coal measures in the United States and England and for that reason searching for coal in that part of Canada would be wasted effort.

The other half of Canada, however, is underlain by rocks of the Precambrian Canadian Shield, which were formed in the early four-fifths of geological time. Life on the earth had not then evolved far enough to leave a fossil record by which the relative ages of the rocks can be ascertained. For these rocks, techniques have been devised to measure their age by the radioactive decay of minerals contained in them and the Survey is now systematically determining ages of rocks of the Shield by these techniques. In a few years the geological history of this vast period of time should be much better known.

Dating of the youngest materials—those not more than 35,000 years old—is done by measuring the radioactivity of carbon. A new laboratory is being set up to provide dates on such material of Pleistocene age from which will be learned the detailed story of the ice ages in Canada and, of particular interest to archaeologists, when prehistoric man came to North America and something of his subsequent migrations.

Geochemistry is a relatively new science of great potential use in mineral exploration. Isotopes of such elements as sulphur, oxygen and lead, and the distribution of these isotopes in rocks, are being carefully studied as a clue to the origin of rocks and of the ore deposits they contain. A radio-chemistry laboratory is being established so that isotopes obtained from nuclear reactors at Chalk River may be used to study diffusion of fluids and chemical elements in rocks, and how elements are taken up by plants. A recently completed geochemical study in Nova Scotia, however, appears to have much more immediate practical application. Much of the mainland of that province was covered by a systematic geochemical survey of stream sediments. The muds from the streams were analysed for lead, zinc and copper, and the amounts of these metals were indicated on a map by contours in much the same way as contours on topographic maps show elevations. The high spots indicated on the maps, however, are not hills but the places where there are concentrations of these valuable metals. It is expected that the concentrations in the streams are close to rocks containing deposits of the same metals and therefore that such maps will lead to the discovery of commercial deposits. The method is not limited to Nova Scotia, of course, and will be used in many other parts of Canada.

Improved techniques now make it possible to analyse samples of bedrock for valuable metals and other elements in the field at the same time as the regular geological mapping is under way. This will improve the quality and usefulness of the maps by showing the distribution of metals and other valuable materials; they will thus be of direct assistance to the prospector in his search for ore deposits.

LABORATORY INVESTIGATIONS

The extensive laboratories of the new Geological Survey Building in Ottawa carry on where reconnaissance mapping leaves off. Only through detailed study can basic geological data obtained in the field be put to practical use in the search for ore deposits.

Mass spectrometer in determining absolute age of ancient rocks.

Infrasizers for separating very fine fractions from crustal rocks so that elements may be concentrated.

Geologist studying thin slices of rock to determine accurately the mineral components.

The possibilities of geochemistry as an aid in the discovery of mineral wealth are only beginning to be known.

The new Geological Survey building has a greenhouse on the roof which is being used to investigate the ways in which plants take up metals and other elements. Some plants concentrate these elements in their leaves or twigs and provide valuable clues in the search for minerals. Thus, if plants over a certain area contain an abundance of, say, copper, then it is possible that the source of the copper is a buried ore deposit. Much more needs to be learned about particular plants and the way they take up minerals before the method can be properly evaluated and applied. Geochemical studies of rocks, soil and plants may also be used to learn more about the accumulation, migration and trapping of petroleum and natural gas, and thus provide data that will help in discovery of future reserves. The possibilities of geochemistry as an aid in the discovery of mineral wealth are only beginning to be realized; a new frontier opens.

The Survey building also has laboratories providing precise analyses of minerals and rocks, special studies on coal seams, data on the deposition of sedimentary material, the mineral composition and origin of rocks, rapid proximate analyses of rocks, crushing of rocks for special studies, and many other problems.

About fifteen years ago an airborne magnetometer was obtained by the Survey. It has since been flown some 640,000 line miles and the resulting data have been published in hundreds of geophysical maps (Fig. 3). The magnetometer records the magnetic pull of the rocks beneath and it is possible, therefore, to recognize places where the magnetism of the rocks is unusually strong or unusually weak. The magnetism is commonly characteristic of the kind of rock, so that it may be possible, also, to trace formations in places where the rocks are covered by overburden or by younger rocks. The geologist is thus able to make his geological maps more accurate and more useful. Because the magnetometer is carried by an aircraft, large areas can be covered in a single season. Here and there a major variation in magnetism—an anomaly—may be recorded, as happened near Marmora in Ontario where an iron deposit was pin-pointed beneath a cover of 100 feet of younger rocks. Other geophysical methods are also being investigated in Survey laboratories in an effort to develop new means of obtaining data that will assist in the discovery of mineral deposits.

In 1959 the Geological Survey and the Ontario Department of Mines began a co-operative geophysical, geochemical and geological study of an area of about 65,000 sq. miles in northwestern Ontario, the better to select possible "roads to resources" in the region. This, it is hoped, is the forerunner of similar projects in other promising mineral areas of Canada.

Not more than 15 to 20 p.c. of Canada is now geologically mapped in adequate detail; the area still to be studied in the field and laboratory will keep geologists occupied for many generations. However, the continuance of this gigantic task will ensure Canada's place in the forefront of world production of metals, fuels and other mineral products.

PART III.—LAND RESOURCES AND PUBLIC LANDS

Section 1.—Land Resources

Information currently available regarding Canada's vast land resources is shown in Table 1, where the land area is classified as occupied agricultural, forested and 'other' land, the latter including urban land, road allowances, grass and brush land and all waste land such as open muskeg, swamp and rock. Soil surveys now under way by the Department of Agriculture will make it possible in the future to estimate the amount of arable land Canada possesses and, as provincial inventories are completed, more information will be available regarding land now non-forested but not productive in an agricultural sense. The Forestry Branch of the Department of Northern Affairs and National Resources estimates that about 48 p.c. of the land area of Canada is forested and, according to the Census of 1956, less than 8 p.c. is classed as occupied farm land. A great part of the 1,611,376 sq. miles of 'other' land is located in the Yukon and Northwest Territories which together have a land area of 1,458,784 sq. miles. The occupied farm land in these Territories is practically nil and the forested area is estimated at 275,800 sq. miles.

1.—Land Area classified as Occupied Agricultural or Forested, by Province

NOTE.—Figures for occupied agricultural land were obtained from the 1936 Census; areas of forested land were compiled by the Forestry Branch, Department of Northern Affairs and National Resources from estimates supplied by the Forestry Service in each province.

¹ Less than one square mile.

² Included in Forested Land; duplication eliminated in the item Net Productive Land.

³ Includes areas of recent burn, cut-over or windfall, not yet re-stocked.

⁴ Areas incapable of producing crops of merchantable timber because of adverse climatic, soil or moisture conditions.

⁵ Includes only occupied agricultural land (less forest woodland) plus productive forested land.

⁶ Comprises all urban land, road allowances, grass and brush land and all waste land such as open muskeg, swamp and rock.

⁷ Net Productive Land plus Non-productive Forested Land plus Other Land.

Section 2.—Public Lands

In Table 2 classifying the area of Canada by tenure, items 2, 3, 4 and 5 are obtained from Federal Government sources and items 1, 6, 7 and 8 from Provincial Government sources.

2.—Total Area classified by Tenure (circa) 1959

¹ Includes Gatineau Park (86 sq. miles) and Quebec Battlefields Park (0.36 sq. mile) which are under federal jurisdiction but are not technically National Parks. ² Less than one square mile. ³ Includes 952,849 sq. miles set aside by Order in Council as native game preserves in which only Indians and Eskimos may hunt, but which are not regarded as National Parks. ⁴ Includes Wood Buffalo Park (13,675 sq. miles) which, although reserved by the Federal Government, is not administered as a National Park. ⁵ That part of Wood Buffalo Park in N.W.T. ⁶ A forest experiment area of 25 sq. miles is included in National Parks figure. ⁷ Provincial forest reserves are also used to some extent as recreational areas.

Subsection 1.—Federal Public Lands

Public lands under the administration of the Federal Government comprise lands in the Northwest Territories including the Arctic Archipelago and the islands in Hudson Strait, Hudson Bay and James Bay, lands in Yukon Territory, Ordnance and Admiralty Lands, National Parks and National Historic Sites, Forest Experiment Stations, Experimental Farms, Indian reserves and, in general, all public lands held by the several Departments of the Federal Government for various purposes connected with federal administration (see Table 2). These lands are administered under the Territorial Lands Act (RSC 1952, c. 263) and the Public Lands Grants Act (RSC 1952, c. 224) which became effective June 1, 1950 and replaced previous legislation.

The largest areas under federal jurisdiction are in the Northwest Territories and Yukon Territory where only 73 sq. miles of a total area of 1,511,979 sq. miles are privately owned. This part of the national domain, with the exception of the islands in Hudson Bay and James Bay, is all north of the 60th parallel of latitude and occupies about 40 p.c. of the surface of Canada. It is under the administration of the Northern Administration Branch of the Department of Northern Affairs and National Resources.

Subsection 2.—Provincial Public Lands

Public lands of Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia (except the Railway Belt and Peace River Block) have been administered since Confederation by the provincial governments. In 1930 the Federal Government transferred the unalienated portions of the natural resources of Manitoba, Saskatchewan and Alberta and of sections of British Columbia to the respective governments and all unalienated lands in the Province of Newfoundland, except those administered by the Federal Government, became provincial public lands under the Terms of Union on Mar. 31, 1949. All land in the Province of Prince Edward Island has been alienated except 126 sq. miles under federal and provincial administration.

Information regarding provincial public lands may be obtained from the respective provinces. (See the Directory of Sources of Official Information, Chapter XXVII, under "Lands".)

Subsection 3.—National and Provincial Parks

The future of Canada in the field of outdoor recreation is being wisely provided for by the establishment of National and Provincial Parks. Many of these parks are easily accessible by highway, rail or air and offer every type of accommodation from camping facilities to cabins and palatial hotels. A wide variety of summer and winter recreational attractions is available in mountain, lakeland, woodland and seaside areas of exceptional scenic beauty.

The extent of the park areas in each province is given in Table 2 on p. 21; location, year of establishment, area, and main characteristics of each National Park are given in Table 3, which is followed by a brief description of the Provincial Parks.

National Parks.—Since 1885 when the first National Park was established around the mineral hot springs in western Alberta at what is now Banff, 18 areas with a total extent of more than 29,000 sq. miles have been established as National Parks. These parks are maintained by the Federal Government for the protection of their flora, fauna and natural phenomena, and for the preservation of their scenic beauty and national interest. They are administered by the National Parks Branch, Department of Northern Affairs and National Resources, and are developed and maintained in such manner as to constitute museums of nature for the perpetual inspiration, education and recreational use of present and future generations.

The National Parks are among Canada's greatest visitor attractions. All types of accommodation are available in privately owned hotels, chalets, lodges, motels and bungalow camps. In several of the Atlantic parks, motels and cabins built by the Parks

Administration have been leased to concessionaires, and in many parks modern camp grounds and trailer sites have been prepared for the use of visitors travelling with their own camping equipment. All kinds of recreational facilities are available—supervised bathing beaches, playgrounds, golf courses, tennis courts, bowling greens and athletic fields. In Banff, Kootenay and Jasper Parks where hot mineral springs occur, the Parks Service has provided outdoor pools, plunge baths and dressing-room facilities, and in other parks outdoor pools, with heated water, have been built. Several of the western parks are year-round resorts—at Banff, Jasper, Waterton Lakes and Mount Revelstoke Parks the skiing is excellent. Ski lifts and tows are in operation in Banff and Jasper Parks, and a chair lift on Mount Norquay and a sedan lift on Whitehorn Mountain, both in Banff, are added attractions. The chair lift on Mount Norquay and a gondola lift on Sulphur Mountain in Banff Park are operated for sightseeing purposes during the summer months. Of special interest to visitors is the Banff School of Fine Arts, where summer courses are conducted by the University of Alberta; also, the New Brunswick School of Arts and Crafts, operated by the provincial Department of Industry and Development, gives short courses in handicrafts to persons holidaying in Fundy Park.

A park warden service is supervised by the park superintendents to protect the forest and wildlife and to maintain constant vigilance for the safety and comfort of visitors. Angling opportunities in park waters are improved and extended by the stocking of game fish, a program assisted by the operation of fish hatcheries in three of the mountain National Parks. The Scientific Management of Game Fish in Canada's National Parks is the subject of a special article on pp. 35-39 of the 1956 Year Book. Two of the National Parks, Wood Buffalo and Elk Island, form sanctuaries for herds of buffalo and other forms of wild animal life.

In addition to the scenic, recreational and wild animal parks, Canada has 17 national historic parks. The National Parks Branch of the Department of Northern Affairs and National Resources is also responsible for the marking, preservation and restoration of places of great historic interest in Canada. More than 525 such sites have been marked on the recommendation of the Historic Sites and Monuments Board of Canada.

3.—Location, Year Established, Area and Characteristics of National Parks

Park	Location	Year Estab- lished	Area	Characteristics
			sq. miles	
Scenic, Recreational and Animal Parks				
Terra Nova.....	On Bonavista Bay, Newfoundland, 150 miles north of St. John's.	1957	156.0	Maritime area now under development; rocky headlands, wooded areas with abundant wildlife, off-shore and fresh-water fishing.
Prince Edward Island..	North shore of Prince Edward Island.	1937	7.0	Strip 25 miles long on shores of the Gulf of St. Lawrence. Recreational area, fine bathing beaches. Accessible by highway. Hotel and bungalow cabin accommodation. Equipped camp grounds.
Cape Breton Highlands.	Northern part of Cape Breton Island, N.S.	1936	367.0	Rugged Atlantic coast line with mountain background. Fine seascapes. Recreational opportunities. Hotel and bungalow cabin accommodation. Equipped camp grounds.
Fundy.....	On Bay of Fundy between Moncton and Saint John in New Brunswick.	1948	79.5	Delightful recreational area. Forested region, wildlife sanctuary, rugged terrain. Bungalow cabin accommodation. Equipped camp grounds.
Georgian Bay Islands..	In Georgian Bay, north of Midland, Ont.	1929	5.4	Recreational and camping area. Unique pillars on Flowerpot Island. Accessible by boat from nearby mainland points. Equipped camp grounds and annual youth camps on Beausoleil Island.

3.—Location, Year Established, Area and Characteristics of National Parks—continued

Park	Location	Year Estab- lished	Area sq. miles	Characteristics
Scenic, Recreational and Animal Parks —continued				
Point Pelee.....	On Lake Erie in south- western Ontario.	1918	6.0	Recreational area. Remarkable beaches, southern flora. Resting place for mi- gratory birds. Accessible by highway. Hotel and bungalow cabin accommoda- tion. Equipped camp grounds.
St. Lawrence Islands...	In St. Lawrence River be- tween Brockville and Kingston, Ont.	1914	172.0 (acres)	Mainland area and 12 islands among Thousand Islands. Recreational and camping area. Accessible by highway; by boat from nearby mainland points.
Riding Mountain.....	Southwestern Manitoba, west of Lake Winnipeg.	1929	1,148.0	Playground and wildlife sanctuary on summit of escarpment. Fine lakes. Accessible by highway. Hotel and bungalow cabin accommodation. Equip- ped camp grounds.
Prince Albert.....	Central Saskatchewan, north of Prince Albert.	1927	1,496.0	Forested region dotted with lakes and interlaced with streams. Summer play- ground and recreational area. Accessible by highway. Hotel and bungalow cabin accommodation. Equipped camp grounds.
Banff.....	Western Alberta, on east slope of Rockies.	1885	2,564.0	Magnificent scenic recreational area; noted resorts, Banff and Lake Louise. Mineral hot springs; summer and winter sports. Accessible by rail and highway. Hotel and bungalow cabin accommodation. Equipped camp grounds.
Elk Island.....	Central Alberta, near Ed- monton.	1913	75.0	Fenced preserve containing large herd of buffalo; also deer, elk and moose. Popular recreational area. Accessible by high- way. Bungalow cabin accommodation and equipped camp grounds.
Jasper.....	Western Alberta, on east slope of Rockies.	1907	4,200.0	Mountain playground and noted wildlife sanctuary. Majestic peaks, ice fields, beautiful lakes and famous resort, Jasper. Mineral hot springs, summer and winter sports. Accessible by rail and highway. Hotel and bungalow cabin accommoda- tion. Equipped camp grounds.
Waterton Lakes.....	Southern Alberta, adjoining Glacier Park in Mon- tana, U.S.A.	1895	203.0	Canadian section, Waterton-Glacier Inter- national Peace Park. Mountain play- ground with spectacular peaks and beautiful lakes. Accessible by highway. Hotel and bungalow cabin accommoda- tion. Equipped camp grounds.
Glacier.....	Southeastern British Col- umbia, on summit of the Selkirk Range.	1886	521.0	Superb alpine region, towering peaks, glaciers and forests. Accessible by rail only. Climbing, skiing, camping.
Kootenay.....	Southeastern British Col- umbia, on west slope of Rockies.	1920	543.0	Encompasses Vermilion-Sinclair section of Banff - Windermere Highway. Broad valleys, deep canyons, mineral hot springs. Hotel and bungalow cabin ac- commodation. Equipped camp grounds.
Mount Revelstoke....	Southeastern British Col- umbia, on west slope of Selkirks.	1914	100.0	Rolling mountain-top plateau. Colourful alpine meadows. Accessible by rail and highway. Summer accommodation in Park; all-year accommodation in town of Revelstoke. Championship ski runs and ski jump. Equipped camp grounds.

3.—Location, Year Established, Area and Characteristics of National Parks—concluded

Park	Location	Year Estab- lished	Area	Characteristics
			sq. miles	
Scenic, Recreational and Animal Parks —concluded				
Yoho.....	Eastern British Columbia, on west slope of Rockies.	1886	507.0	Lofty peaks, magnificent waterfalls, colourful lakes. Yoho and Kicking Horse Valleys. Accessible by rail and highway. Hotel and bungalow cabin accommodation. Equipped camp grounds.
Wood Buffalo ¹	Partly in Alberta and partly in Northwest Territories, between Athabasca and Slave Rivers.	1922	17,300.0	Immense region of forests and open plains. Home of largest remaining herd of bison on the Continent. Other wildlife abundant.
Historic Parks			acres	
Signal Hill.....	St. John's, Nfld.....	1958	243.4	Location of military installations and site of operations and battles in 1700's. Cabot Tower.
Fort Anne.....	Nova Scotia, at Annapolis Royal.	1917	31.0	Site of early Acadian settlement. Museum and well-preserved earthworks.
Fortress of Louisbourg.	Cape Breton Island, N.S., 25 miles from Sydney.	1941	339.5	Ruins of walled city erected by the French, 1713-58. Interesting excavations. Museum.
Halifax Citadel.....	Halifax, N.S.....	1956	36.9	Defence post constructed 1828-35. Museums.
Port Royal.....	Port Royal, N.S., 8 miles from Annapolis Royal.	1941	20.5	Restoration of "Habitation"—first fort built in 1605 by Champlain and DeMonts.
Alexander Graham Bell	Baddeck, N.S.....	1955	14.0	Museum contains mechanical and documentary records of research by the inventor.
Grand Pré.....	Grand Pré, N.S.....	1957	14.0	Commemorates the story of the Acadians.
Fort Beauséjour.....	New Brunswick, near Sackville.	1926	81.3	Site of French fort erected in middle of 18th century. Museum.
Fort Chambly.....	Chambly, Que.....	1941	2.5	Original French fort built on Richelieu River in 1665 was burned. Present fort built by English in 1709-11. Museum.
Fort Lennox.....	Île aux Noix, Que., near St. Johns.	1941	210.0	Original fort, Île aux Noix, built by French in 1759. Fort Lennox built by English in 1820's.
Fort Malden.....	Amherstburg, Ont.....	1941	8.0	Site of defence post built 1797-99. Museums.
Fort Wellington.....	Prescott, Ont.....	1941	8.5	Defence post built 1812-13. Museum.
Woodside.....	Kitchener, Ont.....	1954	12.0	Boyhood home of the Rt. Hon. William Lyon Mackenzie King, former Prime Minister of Canada.
Fort Prince of Wales....	Northern Manitoba, near Churchill.	1941	50.0	Ruins of fort built 1733-71 to secure control of Hudson Bay for England.
Lower Fort Garry	Manitoba, 20 miles north of Winnipeg.	1951	13.0	Stone-walled fort built by the Hudson's Bay Company between 1831 and 1839.
Fort Battleford.....	Saskatchewan, 4 miles south of North Battleford.	1951	36.7	North West Mounted Police post built in 1876.
Fort Langley.....	Fort Langley, B.C.....	1958	9.0	Present fort built in 1840. First permanent British settlement in British Columbia. Museum.

¹ Administered by the Northern Administration Branch, Department of Northern Affairs and National Resources.

Provincial Parks.—In addition to the National Parks described above, most of the provincial governments have established parks within their boundaries. These parks, in the same way as the National Parks, are areas of scenic or other interest, preserved and maintained for the benefit of the public although many of them are still undeveloped. A detailed list of Provincial Parks, showing location, year established, area, and a short description of each, is given in the 1954 Year Book, pp. 26-30. The more important parks in each province are mentioned briefly here.

Newfoundland.—There are 55 sq. miles of provincial parkland in Newfoundland—a 42-sq. mile area on the west coast established as Serpentine Park is undeveloped; Sir Richard Squires Memorial Park on the Upper Humber River and Butter Pot Park on the Avalon Peninsula are under development. Surveys are being conducted with a view to setting aside about 400 acres of Crown lands throughout the province to be used as picnic and camp sites, ranging in size from one-half-acre to 50-acre lots.

Prince Edward Island.—Three properties consisting of 150 acres have been developed as provincial parks: Strathgartney Park, a 40-acre tract of land at Churchill on the Trans-Canada Highway between Charlottetown and Borden, is an excellent picnic and camp site with attractive hardwood groves, fresh spring water and a beautiful view over West River and the surrounding country; Lord Selkirk Park at Eldon has an area of 30 acres and is of historic interest in that it contains an old French cemetery and marks the spot on the shoreline where Lord Selkirk landed; Brudenell River Park at Roseneath along the shore of the Brudenell River comprises 80 acres, much of it woodland. These newly established parks are maintained by the Department of Industry and Natural Resources and meet a long-standing need for public picnic grounds and camp sites. Another 200-acre tract, to be known as Sir Andrew MacPhail's Park, is under development.

Nova Scotia.—The Provincial Department of Lands and Forests has recently announced the formation of a new Parks Division in Nova Scotia. Plans are currently being made to increase the number of provincial parks with adequate facilities for visitors who wish to picnic or to camp overnight. These parks will be located at naturally scenic spots on or close to well-travelled highways throughout the province. Several privately owned areas have been offered for this purpose and provincial personnel are assessing the possibility of others so that development plans may be drawn up.

The Provincial Wildlife Park at Shubenacadie is operated by the Department of Lands and Forests. It is a 30-acre tract of land maintained in its natural state as far as possible consistent with providing housing for the animals and birds that are its main attraction. Such facilities permit the park's annual attendance of some 200,000 visitors to see wildlife at close range. Expansion is planned as more varieties of birds and animals become available and can be absorbed.

Quebec.—The Province of Quebec has established six provincial parks and seven Fish and Game Reserves. Five of the park areas are quite extensive. Saguenay Park, on the north shore of the St. Lawrence River in Saguenay County, has an area of 21,000 sq. miles; La Vérendrye Park, 140 miles northwest of Montreal, has an area of 4,746 sq. miles; Laurentide Park, 30 miles north of Quebec City, is 3,612 sq. miles in extent; Mont Tremblant, 80 miles north of Montreal, 1,223 sq. miles; and Gaspesian Park, Gaspé Peninsula, 514 sq. miles. Mount Orford Park, situated 15 miles west of Sherbrooke, has an area of 15 sq. miles.

The Fish and Game Reserves together occupy more than 10,000 sq. miles. The Chibougamau Reserve and the Mistassini Reserve, both northwest of Lake St. John, cover 3,400 sq. miles and 5,200 sq. miles, respectively. Smaller reserves are the Kipawa Reserve in the Témiscamingue district, the Shickshock Reserve adjoining Gaspesian Park, and the Petite Cascapédia and the Port Daniel, reserved for salmon and trout fishing, both of which lie along the Bay of Chaleur in Gaspé Peninsula.

These parks and reserves are wilderness areas of great scenic interest—for the most part mountainous country threaded with many rivers, lakes and streams and abounding in wildlife. In all of them, except Mount Orford, excellent fishing may be found and most of them have been organized to accommodate sportsmen and tourists in camps, cottages and lodges. Mont Tremblant is a famous resort area in both summer and winter and is easily reached by highway from Montreal. The Department of Game and Fisheries administers the parks and reserves, and also six salmon streams which are open to anglers.

Ontario.—The provincial park program in Ontario has been greatly expanded since 1955. In 1959 the provincial parks system provided supervised camping and picnicking privileges in 57 parks for which a nominal charge was made, and also supervised privileges in 25 park areas undergoing primary stages of development. In addition to these established parks, other areas are in process of acquisition, reserved for future development, or being investigated. The four largest parks—Algonquin, Quetico, Superior and Sibley—together have an area of nearly 4,700 sq. miles. Algonquin, 141 miles north of Toronto and 105 miles west of Ottawa, was the first to be established and is the best known. It is well provided with commercial camps for children and adults and is easily accessible by road. However, the present administrative policy is to encourage the establishment of commercial recreation facilities on the park fringes and to return the park itself to its natural condition. The interiors of Quetico and Superior Parks are also being retained as wilderness areas with fringe development. Quetico Park is accessible by road through the recently developed French Lake camp site, and by water; an extension to Highway No. 17 northward from Sault Ste. Marie will give access to Superior Park; and Sibley Park may be reached by road from Highway No. 17 eastward from Port Arthur.

The parks are administered by the Parks Division of the Department of Lands and Forests, Toronto, from which detailed information is available in brochure form.

Manitoba.—There are ten forest reserves in Manitoba with a total area of 5,386 sq. miles, which are used to a certain extent as recreational areas. Recently, 21 new areas totalling 968 sq. miles in extent have been established as parks and recreational areas.

Saskatchewan.—Saskatchewan has ten provincial parks with a total area of about 2,310 sq. miles. Cypress Hills, Duck Mountain, Greenwater Lake, Moose Mountain, and Valley Centre are operated as summer resorts with chalet, lodge, cabin and trailer accommodation, and camping and picnic facilities. Recreational activities include fishing, boating, swimming, golf, tennis, dancing, baseball, hiking, horseback riding, etc., and the parks are all well fitted with playground and beach equipment for children. In Cypress Hills Park, elk, antelope, deer and beaver are plentiful and brook and other trout abound in the streams and lakes. Heavy stands of tall, straight lodgepole pine provide forest cover in this area. In Duck Mountain, Moose Mountain and Greenwater Lake Parks, moose, elk, deer, bear and beaver are common as well as several varieties of grouse. Spruce, poplar and white birch provide excellent cover for wildlife. Pickerel, pike and perch are prevalent in the lakes.

Alberta.—In Alberta 40 provincial parks have been established with a total area of approximately 138 sq. miles; 34 of these parks are presently under development. The Cypress Hills Provincial Park, covering an area of over 77 sq. miles, is the largest and is situated in the southeast portion of the province. The other parks under development are: Aspen Beach, Beauvais Lake, Big Hill Springs, Bow Valley, Crimson Lake, Cross Lake, Dillberry Lake, Entrance, Garner Lake, Gooseberry Lake, Kinbrook Island, Lac Cardinal, Little Bow, Little Fish Lake, Long Lake, Ma-Me-O Beach, Miquelon Lake, Moonshine Lake, O'Brien, Park Lake, Pembina River, Red Lodge, Rochon Sands, Saskatoon Island,

Steveville Dinosaur, Sylvan Lake, Taber, Thunder, Vermilion, Wabamun Lake, Willow Creek, Winagami Beach, Woolford, and Writing-on-Stone. Picnic facilities, playground equipment and camping areas are provided in these parks, which are maintained primarily for the recreation and enjoyment of the residents of the province.

British Columbia.—There are 146 provincial parks in British Columbia with a total area of about 13,158 sq. miles. These parks are classified as A, B and C. Class A parks are those considered most highly for immediate recreational development and are strongly protected. Class B parks are areas slated for development—valuable wilderness areas or places set aside for a specific reason. Class C parks are intended primarily for the use of local residents and are usually under Board management. The parks are in all stages of development and dedicated to a variety of recreational uses. There are immense wilderness areas such as Tweedsmuir and Wells Gray Parks and outstanding scenic and mountain places which include Garibaldi, Mount Robson and E. C. Manning Parks. Thousands of city dwellers throng to the ski slopes of Mount Seymour or picnic at Cultus Lake Park. The formal gardens of Peace Arch are a monument to the goodwill between Canada and the United States. Vancouver Island has a chain of small forest parks that have achieved a tremendous popularity with tourists—the best known are Little Qualicum Falls and Miracle Beach. In addition there is a camp-site system closely integrated with the provincial parks, many camp sites actually being located in the parks. The famous gold town of Barkerville has become the first Provincial Historical Park. A new venture is the establishment of a Marine Park System. There are now three Marine Parks, all with water access.

Subsection 4.—The National Capital Plan*

Ottawa, the city selected by Queen Victoria in 1857 to be the permanent seat of the legislature of the united provinces of Upper and Lower Canada, was designated the National Capital of the Dominion upon Confederation in 1867. The community grew out of the military and construction camp which served as headquarters for the building of the Rideau Canal—a military project carried out between 1826 and 1832 which utilized the Rideau and Cataraqui Rivers to link Kingston on the St. Lawrence River and Lake Ontario with the Ottawa River thus providing a safe interior military waterway between Lake Ontario and Montreal by bypassing the vulnerable international section of the St. Lawrence River. Originally known as Bytown, after Col. John By, R.E., builder of the canal, the settlement prospered with the development of the lumber trade. The Act of Incorporation, changing Bytown to the City of Ottawa, was proclaimed on Jan. 1, 1855.

The city, situated in an area of great natural beauty, has remained a self-governing municipality and, although throughout the years the Federal Government co-operated with the municipal authorities in the development of a system of driveways and parks, the city expanded without the benefit of any planned direction. In 1946, however, a Master Plan was approved, designed to guide the development of the Capital's urban area over the following half-century and to protect the beauty of the surrounding National Capital District. That District covers an area of about 1,800 sq. miles, half of which lies in the Province of Ontario and half in the Province of Quebec. The co-operation of the Cities of Ottawa and Hull, sixty-two other autonomous municipalities and the two provincial governments is essential to the successful implementation of the Plan. The federal agency responsible for its fulfilment is the National Capital Commission (see p. 139), the lineal descendant of the Federal District Commission which, in turn, replaced the

* Prepared by Peter Aykroyd, Director of Information, National Capital Commission.

Ottawa Improvement Commission. The National Capital Commission is served by a full-time paid chairman and 19 unpaid commissioners representative of every province of Canada. The staff, operating under a general manager, numbers 550.

The major projects under the Master Plan have all been commenced during the past decade. They are concerned with the development of open space, the relocation of railways, the decentralization of government buildings, the provision of a green belt and the development of Gatineau Park.

By the end of 1959, over 4,000 acres of open space had been added to the urban area by the acquisition of land along both shores of the Ottawa River and by the provision of exceptionally wide rights-of-way for parkways throughout Ottawa and to a lesser extent in Hull. In co-operation with the Canadian National Railway System and the Canadian Pacific Railway, the task of removing, by stages, most of the rail lines from the centre of the metropolitan area continues. The program, scheduled for completion by 1965, involves the elimination of 19 miles of track and 27 level crossings together with the acquisition of 449 acres of land for redevelopment. New freight express and passenger terminals will eventually be constructed several miles from the city centre. Toward implementing the plan of decentralizing government services, four large areas have been established for new buildings, well away from central Ottawa—the Montreal Road area, Rideau Heights, Pinecrest and Tunney's Pasture. The Plan calls for the establishment of a green belt about two and a half miles wide to surround the urban zone at an average distance of nine miles from the city centre, requiring the acquisition of about 37,000 acres of land. By the end of 1959, \$20,000,000 had been expended on green-belt purchase and by the end of March 1961 most of the land should be under Commission ownership.

The development of Gatineau Park, a wilderness area triangular in shape with its apex in the heart of Hull and stretching 35 miles northwest into the Laurentian Hills, has proceeded rapidly. By the end of March 1961, 60,000 of the projected 75,000 acres for park use will have been acquired. The Park is now traversed by a scenic parkway which will be extended gradually. Altogether the Commission has completed 26 miles of parkway in Ottawa and 15 miles in Hull and its environs. Another 40 miles are projected. The Commission maintains the grounds of 125 government buildings in the National Capital region and gives assistance to municipal projects that enhance the attractiveness of the area, such as the provision of land and landscaping for the 12-mile Queensway under construction through Ottawa. Planning advice is also offered to other municipalities in the National Capital region.

An Advisory Committee on Design passes on the siting and exterior appearance of all Federal Government buildings in the region and a Historical Advisory Committee advises on the marking and preserving of historic sites.

Estimated expenditure on Commission projects for the year ending Mar. 31, 1961 totals \$17,000,000—\$2,000,000 for administration, operation and maintenance, \$4,000,000 for construction and \$11,000,000 for property acquisition.

Section 3.—Wildlife Resources and Conservation

A series of special articles relating to the wildlife resources of Canada has been carried in previous editions of the Year Book. Articles on Migratory Bird Protection in Canada, Game Fish in Canada's National Parks, The Barren-Ground Caribou, Migratory Bird Legislation, Scientific Management of Game Fish in Canada's National Parks, and The Musk-ox were carried in the 1951, 1952-53, 1954, 1955, 1956 and 1957-58 editions, respectively. A short article on the fur industry appears in the 1959 edition at pp. 603-604.

The Canadian Wildlife Service.*—The Canadian Wildlife Service deals with most wildlife problems coming within the jurisdiction of the Federal Government. The Service was organized in 1947 to meet the growing need for scientific research in wildlife management and is a division of the National Parks Branch, Department of Northern Affairs and National Resources. Its functions include the administration of the Migratory Birds Convention Act in conjunction with the Royal Canadian Mounted Police and in co-operation with the provincial game authorities. It conducts scientific research into wildlife problems in the Northwest Territories, Yukon Territory, and the National Parks of Canada, advises the administrative agencies concerned on wildlife management and co-operates in the application of such advice. It provides co-ordination and advice in connection with the administration of the Game Export Act in the provinces, deals with national and international problems relating to Canada's wildlife resources, and co-operates with other agencies having similar interests and problems in Canada and elsewhere.

The Migratory Birds Convention Act was passed in 1917 to give effect to the Migratory Birds Treaty signed at Washington in 1916. It provides a measure of protection for numerous species of birds that migrate between the two countries. The Canadian Wildlife Service is the federal agency responsible for administration of the Act and for the annual revision of the Migratory Bird Regulations, which govern such matters as open seasons and other waterfowl hunting details, taking and possession of migratory birds for scientific or propagating purposes, eiderdown collecting, etc. The Royal Canadian Mounted Police is responsible for enforcing the Act and Regulations. In both administration and enforcement, provincial authorities co-operate with the Canadian Wildlife Service.

There are 98 migratory bird sanctuaries in Canada with a total area of more than 6,000 sq. miles. A sanctuary may be established on the initiative of the Department or of a provincial or municipal government, or on petition by a private person or organization. Bird banding provides valuable information on the migration of birds and their natural history and is especially useful in waterfowl management. Serially numbered bands supplied by the United States Bureau of Sport Fisheries and Wildlife are used in Canada as well as in the United States.

Investigations of barren-ground caribou in the Northwest Territories and Yukon Territory have continued since 1948. The herds that migrate into parts of the Prairie Provinces adjacent to the Territories have been the object of co-operative studies by the federal and provincial governments. These studies have designated causes for the disastrous decline in caribou numbers, with human utilization heading the list of mortality factors. Predator control and conservation education have been intensified and more stringent hunting regulations are being enforced as a means of mitigating the situation.

Other recent and current projects of the Service include long-term studies of the muskrat of the Mackenzie Delta, beaver in Mackenzie District, white fox in the Eastern Arctic and musk-oxen on the Arctic islands. The large herds of bison in Wood Buffalo National Park have been studied to determine the effects of disease on their health and growth. Biologists of the Service make detailed studies of birds and mammals in the National Parks and advise the National Parks Service, on the basis of the scientific information obtained, concerning the management of these national resources. Damage to cereal crops by wild ducks and cranes has received intensive study. Murres, sea birds of importance to many inhabitants of Newfoundland, were investigated to determine the effects of human activity on their numbers. Much time has been devoted to other species greatly reduced in number or in danger of extinction such as Ross's geese, trumpeter swans and whooping cranes.

* Prepared by the Canadian Wildlife Service, Department of Northern Affairs and National Resources, Ottawa.

The present research staff includes 39 university-trained wildlife biologists stationed at various centres throughout Canada. Ornithologists are located at Vancouver, Edmonton, Saskatoon, Winnipeg, Ottawa, Maple, Ont., Quebec City, Sackville, N.B., and St. John's, Nfld. Mammalogists are stationed in the Northwest Territories at Yellowknife, Fort Smith and Aklavik, at Whitehorse in the Yukon Territory and at Edmonton and Ottawa. Two limnologists are located at Edmonton and a range specialist and a pathologist at Edmonton and Ottawa, respectively. A number of university graduates and undergraduates are engaged annually to assist in summer field work. The Ottawa headquarters includes an administrative staff of about 30 in addition to supervisory research officers. About 25 part-time migratory bird wardens and sanctuary caretakers are employed.

PART IV.—CLIMATE AND TIME ZONES

Section 1.—Climate

The 1959 Year Book carried at pp. 23-51 a comprehensive study on The Climate of Canada, specially prepared by the Meteorological Branch of the Department of Transport. Because of space limitations it was not possible to include in that edition the detailed tabulations of climatic factors for individual meteorological stations. Such tables for 45 stations across Canada are carried on the following pages and a separate reprint is available containing complete textual and tabular data.*

CLIMATIC TABLES

The following tables contain climatic data from a selection of 45 Meteorological Observing Stations throughout Canada. They consist primarily of monthly temperature and precipitation data along with supplementary data on humidity, wind, sunshine, etc. The information listed is intended to give the reader a general knowledge of the basic climatic features of the different sections of the country. Tables are shown for many of the well-known populous cities and also for locations that are representative of large, sparsely populated areas.

Air Temperature.—To obtain representative observations, all temperature stations are equipped with standard shelters in which the thermometers are housed. The thermometers are self-registering mercury maximum and spirit minimum thermometers which are read usually two or four times daily. The shelter is located in the best representative location possible and is installed over level grassy terrain in a spot well away from the sheltering influence of trees and buildings. The thermometers in the shelter are fixed so that the bulbs are approximately four feet above the surface of the ground.

The mean air temperature data have been derived mainly from records for the thirty-year period 1921-50 except for the far northern stations where only shorter records are available. The mean daily maximum temperature for any month is the mean of all the daily maximum temperatures recorded in that particular month for the period of record used. The mean daily minimum temperature is similarly derived from all daily minimum temperature observations. The mean daily temperature is the average of the mean daily maximum and mean daily minimum temperatures. The mean monthly maximum temperature for January is the average of the highest temperature in each January for the period of record and similarly the mean monthly minimum is the average of the lowest temperature for each January. The "highest recorded" and "lowest recorded" temperatures refer to the absolute extremes for the entire period of observations at each station.

Heating Factor.—The degree-day is a unit based upon temperature difference and time, used mainly in estimating fuel consumption and determining the heating load of a building in winter. For any day when the mean temperature is less than 65°F. there are as many degree-days as there are Fahrenheit degrees difference in temperature between 65°F. and the mean temperature for the day. The total degree-days for the month is the sum of the daily deficits of outside temperature below 65°F.

* Reprint *The Climate of Canada* available from the Meteorological Branch, Department of Transport, Toronto, Ontario.

Relative Humidity.—For every temperature there is a maximum amount of water vapour which can exist in a given volume of air. In general, the existing amount of water vapour in a space is less than the maximum possible amount. The relative humidity (per cent) is the percentage of the maximum that is actually present in the air at the time of the observation. Humidity data are obtained regularly from the readings of dry- and wet-bulb thermometers which are housed in the thermometer shelter. The dry- and wet-bulb thermometers are usually artificially ventilated. When the dry-bulb temperature and the difference between the dry- and wet-bulbs are known the relative humidity may be obtained from tables. The relative humidity is ordinarily least in the early afternoon and greatest about dawn. Mean values are given in the tables for six-hour intervals for the ten-year period 1941 to 1950 at most stations.

Precipitation.—The official Canadian rain gauge is a small cylinder with a cross-sectional area of 10 square inches. The gauge is placed in such a position that it is free from all obstructions which might interfere with the catch. The rim of the gauge is one foot above the level ground. The rain is caught in the gauge and is then measured to one-hundredth of an inch with a simple measuring device. The total rainfall for any month is the accumulated total of the daily rainfall amounts. To obtain the mean values of the total rainfall for a certain number of years for any month, the monthly values are added and averaged.

In Canada, freshly fallen snow is measured directly in inches and tenths as it lies on the ground. Observations are made as representative as possible by averaging several measurements and by avoiding snow drifts and wind-swept bare spots. The daily totals of freshly fallen snow are added to give the total snowfall for any month and these monthly totals are averaged for the period of record to give the mean monthly amount.

It has been found that the depth of water obtained from melting newly fallen snow is, on the average, one-tenth of the depth of the snow. Thus, the total precipitation for any month is obtained by adding together the total rainfall and one-tenth of the depth of newly fallen snow. A day with rain is, for the purpose of these tables, one on which one-hundredth of an inch or more has fallen, and a day with snow is one with at least one-tenth of an inch of newly fallen snow.

Other Meteorological Parameters.—Wind data have been obtained from three-cup anemometers with continuously recording anemographs or from hourly observations made from dial-type recorders. The most prevalent direction and average wind speed have been derived from these hourly wind data.

The Campbell-Stokes sunshine recorder is used to measure bright sunshine. With this instrument the bright sunshine is focussed sharply on a card and leaves a burn for the portion of the day during which the sun is shining. Daily and monthly totals of bright sunshine are so obtained and the mean for any particular month is obtained by averaging the individual monthly values.

The average number of days in each month when "thunder" has been heard at least once in the twenty-four hours is listed.

The average number of days each month on which the minimum temperature in the thermometer shelter falls to 32°F. or lower is listed under the heading "freezing temperatures".

For the purpose of these summaries, a frost is said to occur if the minimum thermometer in the thermometer shelter falls to 32°F. or lower. Average dates are given for the last spring frost and first fall frost. The period between these two dates is the average length of the frost-free season.

Symbols.—The interpretation of the symbols used in the climatic tables is as follows:—

... indicates that figures are not appropriate or not applicable.

T indicates a trace of precipitation; in the case of rain or total precipitation, T indicates an average less than 0.005 inch while for snow T indicates an average less than 0.05 inch.

Long-Term Averages and Extremes of Climatic Data for Representative Canadian Stations

NOTE.—For full explanation of terms used and observing methods see pp. 31-32. Blanks have been left throughout these tables where information is missing or where reliable data are not available owing to a short period of record.

Section 2.—Meteorological Observing Stations in Canada*

In 1959, official meteorological observations were taken and recorded at some 1,828 weather reporting stations in Canada. There are several different classes of stations, ranging from the first-order reporting stations at airports where hourly observations of all aspects of the weather are recorded, to the co-operative precipitation observing stations where a volunteer observer makes daily observations of rainfall and snowfall.

The official recording of weather observations in Canada began early in 1840. Although there were some scattered weather records prior to that date, it was at the Toronto Observatory, established by the British Government, that the first scientifically precise Canadian weather observations were recorded. Several additional observing stations were established in the 1860's after control of meteorological work had passed into local governmental hands and a national meteorological service was organized in 1871. By 1876 there were more than 100 stations, 15 of them reporting daily by telegraph to Toronto for forecasting purposes.

Since then, the number of meteorological observing stations has grown steadily. As the mid-west opened up around the turn of the century, they spread into that area and during the past three decades into the sub-Arctic and Arctic regions. At the same time the coverage has improved in the older portions of southeastern Canada. While there are vast areas of Canada where the weather stations are several hundred miles apart, most of the settled portions of the country are represented by first-order hourly reporting stations every 100 miles or so, and by co-operative climatological observing stations at least every 25 miles.

Of the 1,828 weather reporting stations across Canada about 250 are classified as first-order synoptic stations. At most of these stations complete weather observations are made every six hours and at a large percentage of them only slightly less complete observations for aviation forecasts every hour. These weather data, including information on temperature, precipitation, pressure, wind, humidity, cloud and visibility, are sent first by radio and teletype to the different weather offices across the Continent to be used for weather forecasting purposes, and at the end of the month the manuscript reports are dispatched by mail to Meteorological Headquarters for use in compiling climatic statistics. At some 90 of these observing stations, personnel of the Telecommunications Branch of the Department of Transport take weather observations as part of their scheduled duties, while 35 stations are operated in a similar manner by the different Armed Services. Seventy stations are operated by Meteorological Branch personnel and the remainder of the stations are operated under contract, mainly by various transportation and communications companies.

About 1,020 weather observing stations in Canada are classified as climatological stations where the observers record temperature extremes and precipitation once or twice daily and send in monthly data sheets. Most of these climatological observers serve on a voluntary basis and willingly spend several hours a month on their hobby. These observers come from all walks of life—farmers, business men, clergymen, retired people, etc. In addition, many governmental and industrial organizations such as agricultural experimental farms and power companies have incorporated brief climatological duties into the general work of some of their employees. These climatological stations have contributed much useful information on temperature and precipitation for publication by the Meteorological Branch.

There are about 510 stations classified as precipitation stations where rainfall and snowfall only are observed and recorded. Since precipitation varies more rapidly than temperature over short distances, a dense network of these stations is required, especially in large urban areas. Finally, there are about 50 miscellaneous stations where observations of wind, sunshine and temperature are taken for special purposes. In all, the total number of weather stations in Canada has been growing at a rate of more than fifty a year for the past decade and thus a steadily increasing climatic intelligence is assisting Canadians in all economic pursuits.

* Prepared by the Meteorological Branch, Department of Transport, Toronto.

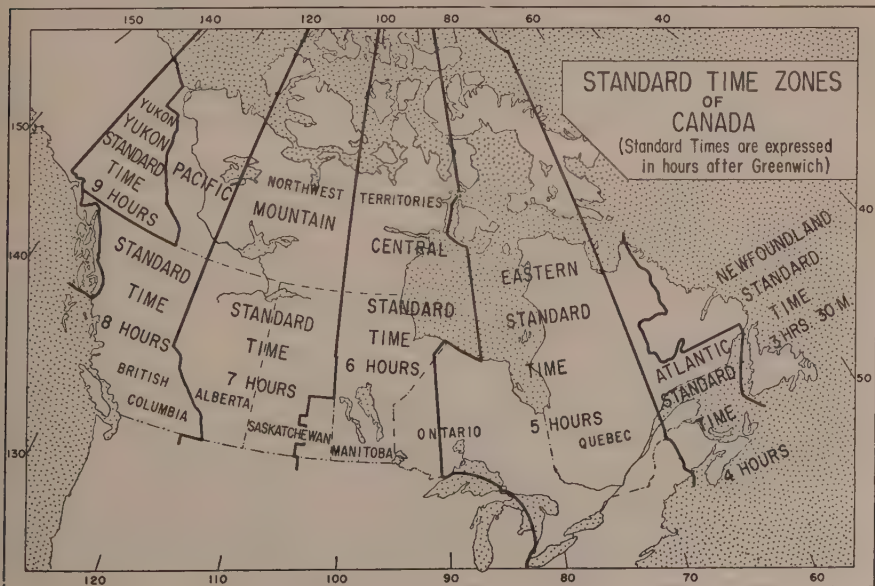

Section 3.—Standard Time and Time Zones

Standard time, which was adopted at a World Conference held at Washington, D.C., in 1884, sets the number of time zones in the world at 24, each zone extending over one twenty-fourth of the surface of the earth and including all the territory between two meridians 15° longitude apart. The basis of world time is Greenwich time and all other time zones are a definite number of hours behind Greenwich.

Canada has seven time zones, the most easterly being Newfoundland standard time, three hours and thirty minutes behind Greenwich time. In the west, Pacific standard time, used throughout British Columbia and part of the Northwest Territories, is eight hours behind Greenwich, and Yukon standard time, used throughout the Yukon Territory, is nine hours behind Greenwich. Some municipalities adopt the time used by the local railways which, in certain cases, differs from the standard. There are also villages that adopt such time as seems best to suit their convenience but in general the legal boundaries of the different time zones are actually in use.

Daylight Saving Time.—For some years before World War I there was active propaganda, particularly in the cities, for the use during the summer months of an earlier time usually referred to as 'daylight saving time', one hour ahead of standard time. It was considered from the economic as well as from the health point of view that people in industrial towns and cities would gain by having longer periods of sunlight at their disposal for recreation. Canada adopted daylight saving time in 1918 but the Canadian Act lapsed at the end of that year. Since that date, however, most cities and towns have adopted daylight saving for varying periods in the summer months.

Legal Authority for the Time Zones.—Most of the regulations made in Canada concerning standard time have been passed by the provincial legislatures and the Northwest Territories Council. Legislation, besides determining the boundaries of zones, regulates such matters as the times of coming into effect or expiration of Acts, ordinances, contracts and agreements, times of opening and closing registration offices, law courts, post offices and other public offices, times of open or close seasons for hunting and fishing, and times of opening and closing business houses and places of amusement.

PART V.—GEOPHYSICS AND ASTRONOMY

Section 1.—Geophysics

Geophysics began with the observations made by early navigators of the weather, ocean tides and the lodestone. These studies gradually developed into modern meteorology, physical oceanography and geomagnetism. To them were added other physical studies of the earth so that geophysics now includes also seismology—the study of earthquakes; hydrology—the study of waters in rivers, lakes, glaciers and underground (but not in the oceans); volcanology—the study of volcanoes and the earth's heat; tectonophysics—the study of the forces that build mountains and slowly cause changes in level of land and sea; the study of the earth's gravity; and several related studies such as the determination of the ages of ancient rocks and minerals from their content of radioactive elements. In addition, magnetic, electrical, gravitational, seismic and radioactive methods of geophysical prospecting are used to direct drilling in almost all the searches going on in Canada for oil and gas. Both airborne and ground devices are widely used by mining companies to prospect for metals.

The Dominion Observatory and the Geological Survey at Ottawa and the Physics Department of the University of Toronto are carrying out major programs of geophysical research. Several other universities across the country and various provincial governments are also doing geophysical work while the major oil companies as well as many other prospecting establishments have developed geophysical techniques as their most effective approach to the problem of finding oil fields and mineral deposits. A detailed study of the operations of the Geological Survey is given at pp. 13-19 of this volume.

Section 2.—Astronomy

The modern era of astronomy in Canada may be said to have begun in 1905 with the completion of the Dominion Observatory at Ottawa, the national observatory of Canada. Prior to that an astronomical observatory established in 1851 at Fredericton, N.B., was used for a short time to determine the longitude of that centre and for general astronomical purposes; it has been rehabilitated as a historic monument. Other small observatories were established, one at Quebec City in 1854 and one at Kingston in 1875. Astronomical instruments were to be associated with the Magnetic Observatory built by the British Government at Toronto in 1839 but there is no record of them being set up until 1881. A small observatory established at McGill University in 1879 was used for many years for time observations.

Today the science of astrophysics is carried on mainly by three Canadian institutions: the Dominion Observatory at Ottawa, Ont., the Dominion Astrophysical Observatory at Victoria, B.C., both of which are administered by the Department of Mines and Technical Surveys, and the David Dunlap Observatory associated with the University of Toronto. Of the two government institutions, the Dominion Observatory at Ottawa specializes mainly in the astronomy of position, in solar physics, in meteoric astronomy and in various branches of geophysical work, while the major effort in astrophysics is concentrated at the Dominion Astrophysical Observatory at Victoria. A new observatory for the study of radio astronomy is being erected at White Lake near Penticton, B.C., and will be jointly operated by the Dominion Observatory and the Dominion Astrophysical Observatory. The David Dunlap Observatory, founded in 1935, is equipped with very fine astrophysical instruments of a kind similar to those in use at Victoria. It performs not only the functions of a privately financed and administered research institution but is also the nucleus of the Department of Astronomy at Toronto University. In addition to the work of these three major institutions and a number of smaller observatories, investigations in the field of meteoric astronomy and radio astronomy are conducted by the National Research Council. Research in the field of space is covered in the Education and Research Chapter, Part III, Section 3.

SECTION 3. MUNICIPAL GOVERNMENT.....	121		
SECTION 4. FEDERAL AND PROVINCIAL ROYAL COMMISSIONS.....	125		

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

PART I.—CONSTITUTION OF CANADA

The Canadian federal state was established by the British North America Act, 1867, which united the three British North American provinces of Canada, New Brunswick and Nova Scotia into one country, divided into four provinces, namely, Ontario, Quebec, New Brunswick and Nova Scotia. British Columbia entered the Union in 1871 and Prince Edward Island in 1873. The Province of Manitoba was created in 1870 and the Provinces of Saskatchewan and Alberta in 1905 out of portions of the territories formerly held by the Hudson's Bay Company which had been admitted to the Union in 1870. Newfoundland entered the Union in 1949. Canada now consists of ten provinces and two territories known as the Yukon Territory and the Northwest Territories.

The British North America Act of 1867 divided both legislative and executive authority between Canada and the provinces. Judicial authority was not similarly divided, federal and provincial courts having jurisdiction with respect to both federal and provincial laws.

Although the British North America Act of 1867 and its subsequent amendments are popularly regarded as the Constitution of Canada, it is not an exhaustive statement of the laws and rules by which Canada is governed. The Constitution of Canada in its broadest sense includes other statutes of the United Kingdom Parliament (e.g., the Statute of Westminster, 1931), statutes of the Parliament of Canada relating to such matters as the succession to the Throne, the demise of the Crown, the Governor General, the Senate, the House of Commons, electoral districts, elections, Royal Style and Titles, and also statutes of provincial legislatures relating to provincial government and provincial legislative assemblies. Other written instruments such as the Royal Proclamation of 1763, early instructions to Governors, Letters Patent creating the offices of Governor and Governor General, and Orders in Council passed pursuant to the British North America

Act also form part of the Canadian constitutional system. In addition the Constitution of Canada includes well-established usages and conventions. The preamble to the British North America Act states that it was the desire of the original provinces to be united "with a constitution similar in principle to that of the United Kingdom" and, accordingly, many of the usages and conventions of government that have been developed in the United Kingdom over the centuries are followed in Canada. For example, the Cabinet system of responsible government as developed in the United Kingdom obtains in Canada although no mention thereof is made in the British North America Act.

No provision was made in the British North America Act of 1867 for amendment thereof by any legislative authority in Canada but both the Parliament of Canada and the provincial legislatures were given legislative jurisdiction with respect to some matters relating to government. Thus, for example, the Parliament of Canada was given jurisdiction with respect to the establishment of electoral districts and election laws and the privileges and immunities of Members of the House of Commons and the Senate, and each provincial legislature was empowered to amend the constitution of the province except as regards the office of Lieutenant-Governor. By an amendment to the British North America Act passed in 1949 the authority of the Parliament of Canada to legislate with respect to constitutional matters was considerably enlarged and it may now amend the Constitution of Canada except as regards the legislative authority of the provinces, the rights and privileges of provincial legislatures or governments, schools, the use of the English or the French language, and the duration of the House of Commons other than in time of real or apprehended war, invasion or insurrection.

Canada's Status in the Commonwealth of Nations.*—The several stages in the development of the status of Canada have been authoritatively described in the reports of successive Imperial Conferences including that held at London in 1926 which defined the group of self-governing communities consisting of the United Kingdom and the Dominions as "autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations". That Conference also recognized that, as a consequence of this equality of status, the Governor General of a Dominion "is the representative of the Crown, holding in all essential respects the same position in relation to the administration of public affairs in the Dominion as is held by His Majesty the King in Great Britain", and that "it is the right of the Government of each Dominion to advise the Crown in all matters relating to its own affairs". Simultaneously with this change in the constitutional relationship between the several parts of the British Commonwealth of Nations there developed as a complementary aspect of nationhood the assumption by the several Dominions of further responsibilities and rights of sovereign States in their relations with other members of the community of nations. Membership in the League of Nations and more recently in the United Nations, the exercise of treaty-making powers and the establishment of separate diplomatic representation in foreign countries have characterized this phase in the growth of Canada. More explicit recognition of the implications of the principles of equality of status was accorded in the Statute of Westminster of 1931 which provided for the removal of the remaining limitations on the legislative autonomy of the Commonwealth nations.

Thus Canada, under the Crown, has equality of status with the United Kingdom and the other Commonwealth nations in both domestic and foreign affairs; its Government advises the Crown in the person of the Governor General on all matters relating to Canada. Canada has membership in the United Nations; makes its own treaties; appoints its own ambassadors and other representatives abroad; levies its own taxes; makes its own laws which are executed by a government dependent on the will of a majority of the people; and maintains its own naval, military and air forces. In short, Canada has achieved full status of democratic nationhood within the Commonwealth of Nations.

* A more detailed account is given in the 1952-53 Year Book, pp. 101-104.

¹ The area of Ontario was extended by the Ontario Boundaries Extension Act, 1912 (SC 1912, c. 40).

² Extended by Quebec Boundaries Extension Act, 1912 (SC 1912, c. 45) and diminished Mar. 1, 1927 in consequence of the Award of the Judicial Committee of the British Privy Council whereby approximately 112,000 sq. miles of territory (formerly considered as part of Quebec) was assigned to Newfoundland.

³ Extended by the Extension of Boundaries Act of Manitoba, 1881 and the Manitoba Boundaries Extension Act, 1912 (SC 1912, c. 32).

⁴ Saskatchewan and Alberta created as provinces in 1905 from the area formerly comprised in the provisional districts of Assiniboia, Athabasca, Alberta and Saskatchewan established May 17, 1882 by minute of Canadian Privy Council concurred in by Dominion Parliament and Order in Council, Oct. 2, 1895.

⁵ By an Imperial Order in Council passed on June 23, 1870 pursuant to the Rupert's Land Act, 1868 (U.K. Stat. 1868, c. 105), the former territories of the Hudson's Bay Company known as Rupert's Land and the North-Western Territory were transferred to Canada effective July 15, 1870. These territories were designated as the North-West Territories by the Act of SC 1869, c. 3 and as the Northwest Territories by RSC 1906, c. 62. By Imperial Order in Council of July 31, 1880 (effective Sept. 1, 1880), all British territories and possessions in North America not already included within Canada and all islands adjacent thereto (with the exception of the Colony of Newfoundland and its dependencies) were annexed to Canada and these additional territories were formally included in the North-West Territories by SC 1905, c. 27. The Province of Manitoba was formed out of a portion of the territories by the Manitoba Act, 1870 (SC 1870, c. 3) and a further portion was added to Manitoba in 1881 by SC 1881, c. 14. The Provinces of Alberta and Saskatchewan were formed out of portions of the territories in 1905 and in 1912 other portions were added to Manitoba, Ontario and Quebec.

⁶ By SC 1876, c. 21, a separate district to be known as the District of Keewatin was established and provision was made for the local government thereof. The Act was expressed to come into force by proclamation. It provided that portions of the District might be re-annexed to the North-West Territories by proclamation; in 1886 a portion of the District of Keewatin was re-annexed and in 1905 the entire Keewatin District was re-annexed. The Act of 1876 was never proclaimed. By Order in Council of May 8, 1882 the provisional districts of Assiniboia, Saskatchewan, Alberta and Athabasca were created for the convenience of settlers and for postal purposes. By Order in Council of Oct. 2, 1895 the further provisional districts of Ungava, Franklin, Mackenzie and Yukon were created. The boundaries of these provisional districts were re-defined by Order in Council of Dec. 18, 1897. Subsequently the Yukon Territory was formed, the Provinces of Alberta and Saskatchewan were created and other portions of the territories were annexed to Quebec, Ontario and Manitoba. By Order in Council dated Mar. 16, 1918 (effective Jan. 1, 1920) the remaining portions of the Northwest Territories were divided into three provisional districts known as Mackenzie, Keewatin and Franklin.

⁷ See p. 120.

⁸ The provisional district of Yukon established in 1895 was created a judicial district of the North-West Territories by proclamation issued pursuant to Sect. 51 of the North-West Territories Act (RSC 1886, c. 50) on Aug. 16, 1897 and by the Yukon Territory Act (SC 1898, c. 6) was declared to be a separate Territory.

PART II.—MACHINERY OF GOVERNMENT

Section 1.—The Federal Government

Subsection 1.—The Executive

The Crown.—The British North America Act provides that “the Executive Government and authority of and over Canada is . . . vested in the Queen”. The functions of the Crown, which are substantially the same as those of the Queen in relation to the Government of the United Kingdom, are discharged in Canada by the Governor General in accordance with established principles of responsible government. The practical executive functions of government are exercised by the Cabinet.

The Queen.—The personal participation of the Queen in the functions of the Crown in Canada has been limited to such occasions as the granting of honours and awards, approval of changes in the Table of Precedence, institution of new military awards, or the periodic appointment of a Governor General. On the occasion of a royal visit, the Queen may participate in those ceremonies that otherwise are carried out in her name, such as the opening and dissolution of Parliament, the assent to Bills, and the granting of a general amnesty.

Apart from her constitutional position in relation to the various governments of the Commonwealth countries, the Queen is Head of the Commonwealth and symbolizes the association of the member countries. Until 1953 the title of the Queen was the same throughout the Commonwealth. Constitutional developments put the title somewhat out of accord with the facts of the position and in December 1952 it was decided by the Prime Ministers of the Commonwealth countries meeting at London, England, that new forms of title for each country should be devised. The title for Canada was approved by Parliament and established by a Royal Proclamation on May 29, 1953. The title of the Queen, so far as Canada is concerned, now is:—

“Elizabeth the Second, by the Grace of God of the United Kingdom, Canada and Her other Realms and Territories Queen, Head of the Commonwealth, Defender of the Faith”.

1.—Sovereigns of Canada since Confederation, 1867

Name	Dynasty	Year of Birth	Date of Accession
Victoria.....	House of Hanover.....	1819	June 20, 1837
Edward VII.....	House of Saxe-Coburg and Gotha.....	1841	Jan. 22, 1901
George V.....	House of Windsor.....	1865	May 6, 1910
Edward VIII.....	House of Windsor.....	1894	Jan. 20, 1936
George VI.....	House of Windsor.....	1895	Dec. 11, 1936
Elizabeth II.....	House of Windsor.....	1926	Feb. 6, 1952

The Governor General.—The Governor General, appointed by the Queen as her personal representative on the advice of the Prime Minister of Canada, traditionally serves for a term of five years. He exercises the executive authority of the Queen in relation to the Government of Canada under Letters Patent issued under the Great Seal of Canada (revised and re-issued, effective Oct. 1, 1947) and the provisions of the British North

America Acts, 1867 to 1952. Acting under the recommendations of his responsible Ministers, in the Queen's name, he summons, prorogues and dissolves Parliament, assents to Bills, and exercises other executive functions.

The Governor General's annual salary and allowances provided by the Parliament of Canada are \$48,666 and \$100,000, respectively. In addition other expenses of office are provided for, including the salary of the Governor General's secretary.

The present Governor General is styled His Excellency Major-General Georges P. Vanier, D.S.O., M.C., C.D.

2.—Governors General of Canada since Confederation, 1867

Name	Date of Appointment	Date of Assumption of Office
VISCOUNT MONCK, G.C.M.G.....	June 1, 1867	July 1, 1867

The EARL OF MINTO, G.C.M.G.....	July 30, 1898	Nov. 12, 1898
EARL GREY, G.C.M.G.....	Sept. 26, 1904	Dec. 10, 1904
FIELD MARSHAL H. R. H. The DUKE OF CONNAUGHT, K.G.....	Mar. 21, 1911	Oct. 13, 1911
The DUKE OF DEVONSHIRE, K.G., G.C.M.G., G.C.V.O.....	Aug. 19, 1916	Nov. 11, 1916
GENERAL The LORD BYNG OF VIMY, G.C.B., G.C.M.G., M.V.O.....	Aug. 2, 1921	Aug. 11, 1921
VISCOUNT WILLINGDON OF RATTON, G.C.S.I., G.C.I.E., G.B.E.....	Aug. 5, 1926	Oct. 2, 1926
The EARL OF BESSBOROUGH, G.C.M.G.....	Feb. 9, 1931	Apr. 4, 1931
LORD TWEEDSMUIR OF ELSFIELD, G.C.M.G., G.C.V.O., C.H.....	Aug. 10, 1935	Nov. 2, 1935
MAJOR-GENERAL The EARL OF ATHLONE, K.G., P.C., G.C.B., G.C.M.G., G.C.V.O., D.S.O.....	Apr. 3, 1940	June 21, 1940
FIELD MARSHAL VISCOUNT ALEXANDER OF TUNIS, K.G., G.C.B., G.C.M.G., C.S.I., D.S.O., M.C., A.D.C.....	Aug. 1, 1945	Apr. 12, 1946
The RIGHT HONOURABLE VINCENT MASSEY, C.H.....	Jan. 24, 1952	Feb. 28, 1952
MAJOR-GENERAL GEORGES P. VANIER, D.S.O., M.C., C.D.....	Aug. 1, 1959	Sept. 15, 1959

The Cabinet.—The Cabinet is a committee of Ministers chosen by the Prime Minister generally from Members of Parliament. By convention, all members of the Cabinet must either have seats in Parliament or secure seats within a short time and, again by convention, all Ministers in charge of departments of government must be members of the House of Commons. Ministers without Portfolio can be members of either House.

The Cabinet, under the leadership of the Prime Minister, directs the business of the Commons, initiates nearly all public Bills placed before Parliament, and has complete responsibility for the initiation of taxes and the recommendation of expenditures. Following established precedent or convention, it is always responsible to the Commons. When

the Cabinet (the Government) suffers defeat on a Government Bill or a vote of censure or on a motion of want of confidence in the Commons, the existing Government or Cabinet must either resign or request a dissolution from the Governor General. If it resigns, the Governor General may call on the Leader of the Opposition in the Commons to form a new Government. Alternatively, if a Government that has been defeated in the House is granted a dissolution and is defeated in the ensuing general election then, should no clear majority be indicated, the Government may decide (1) to remain in office and seek a vote of confidence in the House when it meets or (2) to resign immediately with the consequent result that the Governor General will ask the leader of the party with the highest number of members returned to form a new Government. These alternatives may also eventuate as a result of a general election subsequent to the normal dissolution of Parliament at or near the close of its statutory life.

The primary responsibility of the Governor General in either of the above circumstances is to provide the nation with a Cabinet or Ministry capable of conducting Her Majesty's Government with the support of the House of Commons.

Although appointed by the Governor General, Cabinet members are selected by the Prime Minister from among his party colleagues in such manner as to ensure, as far as possible, representation of the several geographical and political regions of the country and its principal ethnic, religious and social interests. Each Cabinet Minister generally assumes charge of one of the departments of government, although a Minister may hold more than one portfolio at the same time or he may hold one or more portfolios and one or more acting portfolios, or a Minister without Portfolio may hold one or more acting portfolios. In his acting capacity, the Minister exercises the same authority as if he were the Minister of the department. Sessional and other allowances received by Cabinet Ministers are given at pp. 99-100.

3.—Prime Ministers since Confederation, 1867

Ministry	Prime Minister	Length of Administration
1	Rt. Hon. Sir JOHN ALEXANDER MACDONALD.....	July 1, 1867 — Nov. 5, 1873
2	Hon. ALEXANDER MACKENZIE.....	Nov. 7, 1873 — Oct. 16, 1878
3	Rt. Hon. Sir JOHN ALEXANDER MACDONALD.....	Oct. 17, 1878 — June 6, 1891
4	Hon. Sir JOHN JOSEPH CALDWELL ABBOTT.....	June 16, 1891 — Nov. 24, 1892
5	Rt. Hon. Sir JOHN SPARROW DAVID THOMPSON.....	Dec. 5, 1892 — Dec. 12, 1894
6	Hon. Sir MACKENZIE BOWELL.....	Dec. 21, 1894 — Apr. 27, 1896
7	Hon. Sir CHARLES TUPPER.....	May 1, 1896 — July 8, 1896
8	Rt. Hon. Sir WILFRID LAURIER.....	July 11, 1896 — Oct. 6, 1911
9	Rt. Hon. Sir ROBERT LAIRD BORDEN.....	Oct. 10, 1911 — Oct. 12, 1917 (Conservative Administration)
10	Rt. Hon. Sir ROBERT LAIRD BORDEN.....	Oct. 12, 1917 — July 10, 1920 (Unionist Administration)
11	Rt. Hon. ARTHUR MEIGHEN.....	July 10, 1920 — Dec. 29, 1921 (Unionist—"National Liberal and Conservative Party")
12	Rt. Hon. WILLIAM LYON MACKENZIE KING.....	Dec. 29, 1921 — June 28, 1926
13	Rt. Hon. ARTHUR MEIGHEN.....	June 29, 1926 — Sept. 25, 1926
14	Rt. Hon. WILLIAM LYON MACKENZIE KING.....	Sept. 25, 1926 — Aug. 6, 1930
15	Rt. Hon. RICHARD BEDFORD BENNETT.....	Aug. 7, 1930 — Oct. 23, 1935
16	Rt. Hon. WILLIAM LYON MACKENZIE KING.....	Oct. 23, 1935 — Nov. 15, 1948
17	Rt. Hon. LOUIS STEPHEN ST. LAURENT.....	Nov. 15, 1948 — June 21, 1957
18	Rt. Hon. JOHN GEORGE DIEFENBAKER.....	June 21, 1957 — ...

4.—Members of the Eighteenth Ministry, as at Jan. 31, 1960¹

(According to precedence of Ministers)

NOTE.—A complete list of the members of Federal Ministries from Confederation to 1913 appears in the 1912 Year Book, pp. 422-429. Later Ministries will be found in subsequent editions.

¹ Any changes occurring between Jan. 31, 1960 and the date of going to press will be carried in an Appendix to this volume. ² Appointee was not necessarily sworn in on date given.

Parliamentary Secretaries.—As provided by the Parliamentary Secretaries Act (SC 1959, c. 15), assented to June 4, 1959, the following Parliamentary Secretaries were appointed from among the Members of the House of Commons to hold office for twelve months and to assist the respective Ministers in such manner as each Minister may direct. In so doing the Government revived the system of parliamentary assistantships in practice during the war and postwar years subsequent to 1943, whereby Cabinet Ministers might receive assistance in the performance of their parliamentary functions and promising members of the House might secure a degree of apprenticeship for higher public office. In addition to his annual indemnity as a Member of the House of Commons (see p. 99), a Parliamentary Secretary receives \$4,000 per annum and is entitled to certain travelling and other expenses incurred in the discharge of his duties.

5.—Parliamentary Secretaries, as at Jan. 31, 1960

Secretary	Minister	Date of Appointment
PAUL MARTINEAU.....	Prime Minister.....	Nov. 18, 1959
WALLACE B. NESBITT.....	External Affairs.....	Aug. 20, 1959
RICHARD A. BELL.....	Finance.....	Nov. 18, 1959

YVON-ROMA TASSÉ.....	Public Works.....	Nov. 18, 1959

The Privy Council.—The Queen's Privy Council for Canada is composed of eighty to ninety members who are sworn of the Council by the Governor General on the advice of the Prime Minister and who retain membership for life. The Council consists chiefly of present and former Ministers of the Crown. It seldom meets as a body and its constitutional responsibilities as adviser to the Crown in respect to Canada are performed exclusively by a committee thereof consisting of the Ministers who constitute the Cabinet of the day and are also members of the Queen's Privy Council for Canada.

6.—Members of the Queen's Privy Council for Canada According to Seniority Therein, as at Jan. 31, 1960

NOTE.—In this list the prefix "Rt. Hon." indicates membership in the United Kingdom Privy Council. Clerk of the Privy Council and Secretary to the Cabinet, R. B. BRYCE; Assistant Clerk of the Privy Council, A. M. HILL.

Member ¹	Date When Sworn In	Member ¹	Date When Sworn In

¹ The ordinary legal limit of duration for each Parliament is five years. ² Duration of Parliament in years, months and days. The life of a Parliament is counted from the date of return of election writs to the date of dissolution, both days inclusive (B.N.A. Act, Sect. 50). ³ Date of general election. ⁴ Writs returnable. ⁵ Dissolution of Parliament. ⁶ Includes long adjournment from Nov. 29, 1956 to Jan. 8, 1957.

Subsection 2.—The Legislature

The federal legislative authority is vested in the Parliament of Canada consisting of the Queen, an Upper House styled the Senate, and the House of Commons. Bills may originate in either the Senate or the House subject to the provisions of Sect. 53 of the British North America Act, 1867, which provides that Bills for the appropriation of any part of the public revenue or the imposition of any tax or impost shall originate in the House of Commons. Bills must pass both Houses and receive Royal Assent before becoming law. In practice most public Bills originate in the House of Commons although there has been a marked increase recently in the introduction of public Bills in the Senate, at the instance of the Government, in order that Bills may be dealt with in the Senate while the Commons is engaged in other matters, such as the debate on the Speech from the Throne. Private Bills usually originate in the Senate. The Senate may delay, amend or even refuse to pass Bills sent to it from the Commons, but differences are usually settled without serious conflict. (See Chap. XXVII for current legislation.)

Under Sect. 91 of the British North America Acts, 1867-1952, the legislative authority of the Parliament of Canada extends to the following matters: the amendment of the Constitution of Canada (subject to certain exceptions); the public debt and property; the regulation of trade and commerce; unemployment insurance; the raising of money by any mode or system of taxation; the borrowing of money on the public credit; postal service; the Census and statistics; militia, military and naval service, and defence; the fixing of and providing for the salaries and allowances of civil and other officers of the Government of Canada; beacons, buoys, lighthouses and Sable Island; navigation and shipping; quarantine and the establishment and maintenance of marine hospitals; sea coast and

inland fisheries; ferries between a province and any British or foreign country or between two provinces; currency and coinage, banking, incorporation of banks and the issue of paper money; savings banks; weights and measures; bills of exchange and promissory notes; interest; legal tender; bankruptcy and insolvency; patents of invention and discovery; copyrights; Indians and lands reserved for the Indians; naturalization and aliens; marriage and divorce; the criminal law, except the constitution of courts of criminal jurisdiction, but including the procedure in criminal matters; the establishment, maintenance and management of penitentiaries; such classes of subjects as are expressly excepted in the enumeration of the classes of subjects by these Acts assigned exclusively to the legislatures of the provinces.

Under Sect. 95, the Parliament of Canada may make laws in relation to agriculture and immigration concurrently with provincial legislatures although federal legislation is paramount in the event of conflict. By the British North America Act, 1951 (U.K. Stat. 1950-51, c. 32) it is declared that the Parliament of Canada might make laws in relation to old age pensions in Canada but no such law shall affect the operation of any provincial laws in relation to old age pensions.

The Senate.—From an original membership of 72 at Confederation, the Senate, through the addition of new provinces and the general growth of population, now has 102 members, the latest change in representation having been made on the admission of Newfoundland to Confederation in 1949. The growth of representation in the Senate is traced in the 1940 Year Book, pp. 47-49, and is summarized by provinces in Table 8.

Senators are appointed for life by the Governor General by instrument under the Great Seal of Canada on the recommendation of the Prime Minister. The actual power of appointing Senators resides by constitutional usage in the Prime Minister whose advice the Governor General accepts in this regard. In each of the four main divisions of Canada, except Quebec, Senators represent the whole of the province for which they are appointed; in Quebec one Senator is appointed for each of the 24 electoral divisions of what was formerly Lower Canada. The deliberations of the Senate are presided over by a Speaker appointed by the Governor General in Council (in effect by the Government) and government business in the Senate is sponsored by the Government Leader in the Senate.

The Senate is not a competitor of the House of Commons in the field of legislation, but, in the main, acts as a second chamber giving further scrutiny to legislation initiated in the House of Commons. Under the Constitution, Bills for appropriating any part of the public revenue or for imposing a tax or impost must originate in the Commons but in every other respect, since both Houses must concur in every piece of legislation, the Senate has an equal voice with the House of Commons.

9.—Members of the Senate, by Province, as at Jan. 31, 1960¹

¹ Any changes occurring between Jan. 31, 1960 and the date of going to press will be carried in an Appendix to this volume.

The House of Commons.—The British North America Act, 1867 provided that in respect of representation in the House of Commons the Province of Quebec should have the fixed number of sixty-five members and that there should be assigned to each of the other provinces such a number of members as would bear the same proportion to the number of its population as the number sixty-five bears to the number of the population of Quebec. This Act also provided that on the completion of a census in 1871 and of each subsequent decennial census the representation of the several provinces should be re-adjusted from time to time provided the proportionate representation of the provinces as prescribed by the Act were not thereby disturbed.

In the session of 1946 the House of Commons adopted a resolution stating that the effect of the provisions of the British North America Act relating to representation had not been satisfactory in that proportionate representation of the provinces according to population had not been maintained and that a more equitable apportionment of members to the various provinces could be effected if readjustments were made on the basis of the population of all the provinces taken as a whole. The Act was amended accordingly in 1946 to provide a new rule to regulate representation in the House of Commons. Generally speaking, representation was fixed as follows:—

The membership assigned to each province shall be computed by dividing the total population of the provinces by two hundred and fifty-four and by dividing the population of each province by the quotient so obtained.

This rule, employed in the redistribution of representation made in 1947, was effective in the general election of 1949.

After the completion of the 1951 Census it was apparent that as a result of a wartime shift of population a substantial reduction in the representation of the Province of Saskatchewan would ensue under the rules then regulating representation. Accordingly, in an effort to eliminate sharp reductions in provincial representation from one census to another, the British North America Act was again amended to provide representation on the following basis:—

“Sect. 51.—(1) Subject as hereinafter provided, the number of members of the House of Commons shall be two hundred and sixty-three and the representation of the provinces therein shall forthwith upon the coming into force of this section and thereafter on the completion of each decennial census be readjusted by such authority, in such manner, and from such time as the Parliament of Canada from time to time provides, subject and according to the following rules:—

“1. There shall be assigned to each of the provinces a number of members computed by dividing the total population of the provinces by two hundred and sixty-one and by dividing the population of each province by the quotient so obtained, disregarding, except as hereinafter in this section provided, the remainder, if any, after the said process of division.

“2. If the total number of members assigned to all the provinces pursuant to rule one is less than two hundred and sixty-one, additional members shall be assigned to the provinces (one to a province) having remainders in the computation under rule one commencing with the province having the largest remainder and continuing with the other provinces in the order of the magnitude of their respective remainders until the total number of members assigned is two hundred and sixty-one.

“3. Notwithstanding anything in this section, if upon completion of a computation under rules one and two, the number of members to be assigned to a province is less than the number of senators representing the said province, rules one and two shall cease to apply in respect of the said province, and there shall be assigned to the said province a number of members equal to the said number of senators.

“4. In the event that rules one and two cease to apply in respect of a province then, for the purpose of computing the number of members to be assigned to the provinces in respect of which rules one and two continue to apply, the total population of the provinces shall be reduced by the number of the population of the province in respect of which rules one and two have ceased to apply and the number two hundred and sixty-one shall be reduced by the number of members assigned to such province pursuant to rule three.

“5. On any such readjustment the number of members for any province shall not be reduced by more than fifteen per cent below the representation to which such province was entitled under rules one to four of this subsection at the last preceding readjustment of the representation of that province, and there shall be no reduction in the representation of any province as a result of which that province would have a smaller number of members

than any other province that according to the results of the then last decennial census did not have a larger population; but for the purposes of any subsequent readjustment of representation under this section any increase in the number of members of the House of Commons resulting from the application of this rule shall not be included in the divisor mentioned in rules one to four of this subsection.

"6. Such readjustment shall not take effect until the termination of the then existing Parliament.

"(2) The Yukon Territory as constituted by chapter forty-one of the Statutes of Canada, 1901, shall be entitled to one member, and such other part of Canada not comprised within a province as may from time to time be defined by the Parliament of Canada shall be entitled to one member." (RSC 1952, c. 304.)

The principal effect of these latest rules is that the representation of any province shall not be reduced by more than 15 p.c. at any one readjustment, subject however to the qualification that the rule shall not work out in such manner that the representation of a province with a smaller population shall be greater than any province with a larger population.

Subsequently, Parliament enacted a measure, "An Act to readjust the Representation in the House of Commons, 1952", effective in the general election of 1953, which provided that representation in the House of Commons shall be on the following basis:—

"Sect. 2.—Eighty-five members of the House of Commons shall be elected for the Province of Ontario, seventy-five for the Province of Quebec, twelve for the Province of Nova Scotia, ten for the Province of New Brunswick, fourteen for the Province of Manitoba, twenty-two for the Province of British Columbia, four for the Province of Prince Edward Island, seventeen for the Province of Saskatchewan, seventeen for the Province of Alberta, seven for the Province of Newfoundland, one for the Yukon Territory and one for Mackenzie district of the Northwest Territories, thus making a total of two hundred and sixty-five members." (RSC 1952, c. 334.)

The number of representatives of each province elected at each of the 23 general elections since Confederation is given in Table 10.

Under their parliamentary system of representation, based on a "constitution similar in principle to that of the United Kingdom", the people of Canada elect representatives having various political party affiliations as shown in Table 11. In a general election, the Canadian electorate not only determines what political party leader shall be called on to form the Government of the day, but it also decides which of the parties is to become the Official Opposition. Her Majesty's Loyal Opposition occupies an essential place in constitutions based on the British parliamentary system, in that its function is to oppose or criticize in debate the Government in power—an essential to good government at all times. The Official Opposition is founded, like such institutions as the Cabinet and the Prime Ministership, on unwritten custom that has become firmly established. Although the position of Leader of the Opposition is not recognized in the British North America

Act, it received statutory acknowledgment in the Canadian Parliament in 1905 when the Senate and House of Commons Act (SC 1905, c. 43, Sect. 2) provided an additional sessional allowance to "the member occupying the recognized position of Leader of the Opposition in the House of Commons".

11.—Electoral Districts, Voters on List and Votes Polled, Names and Addresses of Members of the House of Commons as Elected at the Twenty-Fourth General Election, Mar. 31, 1958, and Revised to Jan. 31, 1960.¹

Speaker.....	HON. ROLAND MICHENER
Prime Minister.....	RT. HON. JOHN GEORGE DIFENBAKER
Leader of the Opposition.....	HON. LESTER B. PEARSON
Clerk of the House of Commons.....	LÉON J. RAYMOND

NOTE.—The vote is summarized by provinces in Table 13, p. 100. The leaders of the political parties are indicated by asterisks (*). This information, except the population of constituencies, has been supplied by the Chief Electoral Officer. Party affiliations are unofficial. P.C.=Progressive Conservative; Lib.=Liberal; C.C.F.=Co-operative Commonwealth Federation; L-Lab.=Liberal-Labour.

¹ By-elections from Jan. 31, 1960 to the date of going to press are included in an Appendix to this volume.

Indemnities and Allowances.—Members of the Senate receive a sessional allowance at the rate of \$8,000 per annum. In addition they receive at the end of each calendar year an annual expense allowance of \$2,000 which is subject to income tax. Members of the House of Commons are paid a sessional allowance at the rate of \$8,000 per annum. In addition they receive \$2,000 as an expense allowance paid at the end of each calendar year. This allowance, except that for Ministers of the Crown and for Leaders of the Opposition in the House and in the Senate, is not subject to income tax. The remuneration of the Prime Minister is \$25,000 a year and of a Cabinet Minister and the Leader of the Opposition \$15,000 a year in addition to the sessional allowance and expense allowance each receives as a Member of Parliament. A Cabinet Minister is also entitled to a motor car allowance of \$2,000. The remuneration of a Minister without Portfolio is \$7,500 a year in addition to the sessional allowance and expense allowance, the latter taxable. The Speaker of the Senate and of the House of Commons each receives, besides the sessional

allowance and expense allowance, a salary of \$9,000 and a motor car allowance of \$1,000 and each is entitled to \$3,000 in lieu of a residence. The Deputy Speaker of the House of Commons receives a salary of \$6,000 and an allowance of \$1,500 in lieu of a residence. The Deputy Chairman of Committees receives an annual allowance of \$2,000. Parliamentary Assistants to the Ministers of the Crown receive \$8,000 sessional allowance. Members of Parliament, \$4,000 a year as Parliamentary Assistants and the \$2,000 expense allowance paid to all Members of Parliament.

The Federal Franchise.—The present federal franchise laws are contained in the Canada Elections Act (RSC 1952, c. 23). The franchise is conferred upon all Canadian citizens or British subjects, men and women, who have attained the age of 21 years and who have been ordinarily resident in Canada for 12 months prior to polling day at a federal election and ordinarily resident in the electoral district on the date of the issue of the writ ordering such election. Persons denied the right to vote are:—

- (1) The Chief Electoral Officer and the Assistant Chief Electoral Officer;
- (2) Judges appointed by the Governor General in Council;
- (3) The returning officer for each electoral district;
- (4) Persons undergoing punishment as inmates of any penal institution for the commission of any offence;
- (5) Persons restrained of their liberty or deprived of the management of their property by reason of mental disease;
- (6) Persons disqualified under any law relating to the disqualification of electors for corrupt and illegal practices.

Until Mar. 31, 1960, the list of persons denied the right to vote included "Indians ordinarily resident on an Indian reserve who were not members of His Majesty's Forces in World Wars I or II or who did not execute a waiver of exemption under the Indian Act from taxation on and in respect of personal property". Legislation passed by Parliament on the above-mentioned date* confers upon all Indians who have attained the age of 21 years, the right to vote at federal elections, without taking from them any of the rights and privileges to which they are entitled under the Indian Act.

The Canadian Forces Voting Regulations set out in Schedule III to the Canada Elections Act prescribe voting procedure for members of the Armed Forces of Canada and also for veterans in receipt of treatment or domiciliary care in certain institutions.

* Act not yet proclaimed at date of going to press.

13.—Voters on the Lists and Votes Polled at the Federal General Elections of 1949, 1953, 1957 and 1958

NOTE.—Corresponding statistics for the general elections of 1911, 1917, 1921 and 1925 are given in the 1926 Year Book, p. 82; those for 1926 in the 1945 edition, p. 66; those for 1930 and 1935 in the 1948-49 edition, p. 94; those for 1940 in the 1956 edition, p. 81; and those for 1945 in the 1957-58 edition, p. 57.

District of Mackenzie River.

Subsection 3.—The Judiciary

The Federal Judiciary

The Parliament of Canada is empowered by Sect. 101 of the British North America Act to provide from time to time for the constitution, maintenance and organization of a general Court of Appeal for Canada and for the establishment of any additional courts for the better administration of the laws of Canada. Under this provision, Parliament has established the Supreme Court of Canada, the Exchequer Court of Canada and certain miscellaneous courts.

Supreme Court of Canada.—This Court, first established in 1875 and now governed by the Supreme Court Act (RSC 1952, c. 259), consists of a chief justice, who is called the Chief Justice of Canada, and eight puisne judges. The chief justice and the puisne judges are appointed by the Governor in Council and they hold office during good behaviour but are removable by the Governor General on address of the Senate and the House of Commons. They cease to hold office upon attaining the age of 75 years. The Court sits at Ottawa and exercises general appellate jurisdiction throughout Canada in civil and criminal cases. The Court is also required to consider and advise upon questions referred to it by the Governor in Council and it may also advise the Senate or the House of Commons on private Bills referred to the Court under any rules or orders of the Senate or of the House of Commons.

Appeals may be brought from any final judgment of the highest court of final resort in a province in any case where the amount or value of the matter in controversy exceeds the sum of \$10,000. An appeal may be brought from any other final judgment with leave of the highest court of final resort in the province; if such court refuses to grant leave the Supreme Court of Canada may grant leave to appeal. The Supreme Court may grant leave to appeal from any judgment whether final or not. Appeals in respect of indictable offences are regulated by the Criminal Code. Appeals from federal courts are regulated by the statute establishing such courts. The judgment of the Supreme Court of Canada in all cases is final and conclusive.

14.—Chief Justice and Judges of the Supreme Court of Canada, as at Jan. 31, 1960

(In order of seniority)

Name	Date of Appointment
Hon. Chief Justice PATRICK KERWIN.....	July 1, 1954 ¹

Hon. Justice WILFRED JUDSON.....	Feb. 5, 1958
Hon. Justice ROLAND A. RITCHIE.....	May 5, 1959

¹ First appointed as a Judge of the Supreme Court, July 20, 1935.

Exchequer Court of Canada.—The Exchequer Court was first established in 1875 as part of the Supreme Court of Canada but is now a separate court governed by the Exchequer Court Act (RSC 1952, c. 98). The Court consists of a president and four puisne judges who are appointed by the Governor in Council. The president and the puisne judges hold office during good behaviour but may be removed by the Governor General on address of the Senate and the House of Commons. They cease to hold office upon attaining the age of 75 years. The Court sits at Ottawa and also at any other place in Canada where sittings may be fixed by the Court. The jurisdiction of the Court extends to cases where claims are made by or against the Crown in right of Canada. Proceedings against the Crown are taken by petition of right pursuant to the Petition of Right Act (RSC 1952, c. 210).

An appeal lies to the Supreme Court of Canada from any final judgment of the Exchequer Court in which the amount in controversy exceeds \$500; an appeal also lies with leave of the Supreme Court in certain cases where the amount in controversy does not exceed \$500 or where the judgment is not final.

The Exchequer Court also exercises admiralty jurisdiction in Canada. This was first conferred in 1891 by the Admiralty Act (SC 1891, c. 29) and is now governed by the Admiralty Act (RSC 1952, c. 1). Under this statute the Exchequer Court is continued as a Court of Admiralty. The president and puisne judges of the Exchequer Court exercise admiralty jurisdiction throughout the whole of Canada. In addition, Canada is divided into various admiralty districts; a district judge in admiralty is appointed for each district. Appeals to the Supreme Court of Canada from judgments of the president or the puisne judges are governed by the general appeal provisions in the Exchequer Court Act. Appeals may be taken from a final judgment of a district judge in admiralty either to the Exchequer Court or direct to the Supreme Court of Canada.

Miscellaneous Courts.—*Railway Act.*—The Railway Act, 1903 (RSC 1952, c. 234), established the Board of Railway Commissioners for Canada as a court of record; by the Transport Act, 1938 (RSC 1952, c. 271) the name was changed to the Board of Transport Commissioners for Canada. This Court exercises jurisdiction with respect to railway matters. The Governor in Council is given jurisdiction to vary any order of the Board and an appeal lies from the Board to the Supreme Court of Canada upon a question of jurisdiction or a question of law.

Bankruptcy Act.—By virtue of Sect. 91 (21) of the British North America Act, 1867, Parliament has exclusive legislative jurisdiction in relation to bankruptcy and insolvency. By the Bankruptcy Act (RSC 1952, c. 14) the superior courts of the provinces are constituted bankruptcy courts; original jurisdiction is conferred upon the trial courts and appellate jurisdiction is conferred upon the appeal courts of the provinces.

Income Tax Act and Estate Tax Act.—By the Income Tax Act (RSC 1952, c. 148) the Tax Appeal Board is established consisting of a chairman and not fewer than two or more than four members with jurisdiction over appeals against income tax assessments. A further appeal may be taken to the Exchequer Court. Under the Estate Tax Act (SC 1958, c. 29) the Tax Appeal Board also has jurisdiction to hear appeals from assessments under that Act.

Provincial and Territorial Judiciaries*

Certain provisions of the British North America Act govern to some extent the provincial judiciaries. Under Sect. 92 (14) the legislature of each province exclusively may make laws in relation to the administration of justice in the province including the constitution, maintenance and organization of provincial courts both of civil and of criminal jurisdiction. Sect. 96 provides that the Governor General shall appoint the judges of the superior, district and county courts in each province, except those of the courts of probate in Nova Scotia and New Brunswick. Sect. 100 provides that the salaries, allowances and pensions of judges of the superior, district and county courts (except the courts of probate in Nova Scotia and New Brunswick) are to be fixed and provided by the Parliament of Canada and these are set out in the Judges Act (RSC 1952, c. 159). Under Sect. 99 the judges of the superior courts hold office during good behaviour but are removable by the Governor General on address of the Senate and the House of Commons. The tenure of office of district and county court judges is fixed by the Judges Act as being during good behaviour and their residence within the county or union of counties for which the court is established.

All provinces have minor courts with limited civil and criminal jurisdiction, the judges of which are appointed by provincial authority as, for example, justices of the peace, magistrates and juvenile court judges. Except in Quebec there are county or district courts of each province with limited jurisdiction varying from \$500 to \$2,500

* More detailed information concerning provincial judiciaries is given in the 1954 Year Book, pp. 48-55.

in amount. Each province has a superior court with virtually unlimited jurisdiction variously known as Court of Queen's Bench, Supreme Court, Superior Court, etc. There is also a Court of Appeal in each province.

The Yukon Act and the Northwest Territories Act each provide for a superior court of record in and for the Territory, called the Territorial Court, and consisting of one or more judges appointed by the Governor in Council. The judges of the Territorial Court of the Yukon Territory are *ex officio* judges of the Territorial Court of the Northwest Territories. The superior courts of adjacent provinces exercise certain concurrent jurisdiction in civil matters. Police magistrates and justices of the peace have jurisdiction in minor civil and criminal cases.

Section 2.—Provincial and Territorial Governments*

In each of the provinces, the Queen is represented by a Lieutenant-Governor appointed by the Governor General in Council. The Lieutenant-Governor acts on the advice and with the assistance of his Ministry or Executive Council which is responsible to the Legislature and resigns office under circumstances similar to those described on pp. 85-86 concerning the Federal Government.

The Legislature of each province is unicameral, consisting of the Lieutenant-Governor and a Legislative Assembly, except for the Province of Quebec where there is a Legislative Council as well as a Legislative Assembly.

The Legislative Assembly is elected by the people for a statutory term of five years but may be dissolved within that period by the Lieutenant-Governor on the advice of the Premier of the province.

The source of legislative authority of the Provincial Legislatures is the British North America Act, 1867 (U.K. Stat. 1867, c. 3 and amendments). Under Sect. 92 of the Act the Legislature of each province exclusively may make laws in relation to the following matters: amendment of the constitution of the province except as regards the Lieutenant-Governor; direct taxation within the province; borrowing of money on the credit of the province; establishment and tenure of provincial offices and appointment and payment of provincial officers; the management and sale of public lands belonging to the province and of the timber and wood thereon; the establishment, maintenance and management of public and reformatory prisons in and for the province; the establishment, maintenance and management of hospitals, asylums, charities and eleemosynary institutions in and for the province, other than marine hospitals; municipal institutions in the province; shop, saloon, tavern, auctioneer and other licences issued for the raising of provincial or municipal revenue; local works and undertakings other than interprovincial or international lines of ships, railways, canals, telegraphs, etc., or works which, though wholly situated within one province, are declared by the Federal Parliament to be for the general advantage either of Canada or of two or more provinces; the incorporation of companies with provincial objects; the solemnization of marriage in the province; property and civil rights in the province; the administration of justice in the province including the constitution, maintenance and organization of provincial courts both of civil and of criminal jurisdiction including procedure in civil matters in these courts; the imposition of punishment by fine, penalty or imprisonment for enforcing any law of the province relating to any of the aforesaid subjects; generally all matters of a merely local or private nature in the province.

Further, in and for each province the Legislature exclusively may, under Sect. 93, make laws in relation to education subject to certain restrictions relating to the establishment of schools by religious minorities. These powers with similar restrictions were conferred on the more recently admitted provinces on their inclusion as units in the federation.

* The information given in Subsections 1 to 9 of this Section is brought up to Oct. 31, 1959. Provincial elections held between that date and the date of going to press are carried in an Appendix to this volume.

The Provincial Legislatures may also make laws under Sect. 95 in relation to agriculture and immigration, subject to any laws of the Parliament of Canada in relation to these subjects.

Provincial Franchise.—Details regarding qualifications and disqualifications of the franchise are contained in the Elections Act of each province. In general, every person male or female, at the age of 21 years who is a Canadian citizen or a British subject, who complies with certain residence requirements in the province and the electoral district of polling and who falls under no statutory disqualifications, is entitled to vote. These qualifications apply with modifications to voters in most provinces. The principal exceptions give voting privileges to persons in Saskatchewan at the age of 18 and in Alberta and British Columbia at 19 years.

Subsection 1.—Newfoundland

The Government of Newfoundland consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. The Legislative Assembly has 36 members elected for a term of five years. The Legislature elected Aug. 20, 1959 is the 32nd in the history of Newfoundland and the 4th since Confederation.

Since the date of Confederation, Mar. 31, 1949, the province has had three Lieutenant-Governors: the Hon. Sir Albert Joseph Walsh commissioned Apr. 1, 1949; the Hon. Lt.-Col. Sir Leonard Outerbridge commissioned Sept. 5, 1949; and the Hon. Campbell Macpherson commissioned Dec. 16, 1959. The first Ministry, formed on July 13, 1949 under the leadership of the Hon. Joseph R. Smallwood, was still in office on Oct. 31, 1959.

The Premier receives a salary of \$10,000 and the other Cabinet Ministers \$9,000 per annum, plus a sessional indemnity of \$3,333.33. Each member of the House of Assembly receives a sessional indemnity of \$3,333.33 plus a travelling and expense allowance of \$1,666.66. An additional allowance of \$3,000 is made to the Leader of the Opposition.

15.—First Ministry of Newfoundland, as at Oct. 31, 1959

¹ Minister not necessarily sworn in on date of appointment.

Subsection 2.—Prince Edward Island

The Government of Prince Edward Island consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. The General Assembly elected Sept. 1, 1959 is the 49th in the history of Prince Edward Island Legislatures and the 24th since Confederation. It has 30 members from 15 electoral districts who serve for a statutory term of five years. One-half of the members of the Legislative Assembly are elected on a property vote. Each district elects one Councillor (elected on a property vote) and one Assembly member (elected on a general franchise vote).

The annual salary of the Premier is \$6,000 and that of a Cabinet Minister \$4,000. Each member of the Assembly is paid \$1,450 for each session attended by him and an additional \$500 tax free as indemnity for expenses incurred. The Speaker is paid an additional \$400 and a further additional \$200 tax free as an indemnity. The Leader of the Opposition is paid an additional \$800 and a further additional \$200 tax free for expenses incurred by him in performance of official duties.

Subsection 4.—New Brunswick

The Government of New Brunswick has a Lieutenant-Governor, an Executive Council and a House of Assembly. The Legislature elected June 18, 1956 is the 43rd in New Brunswick's history and the 16th since Confederation. It has 52 members who are elected for a statutory term of five years.

The Premier receives \$5,000 per annum in addition to the salary for any other portfolio he may hold. The salary of each Cabinet Minister is \$7,500 and the amount paid as indemnity to each member of the House of Assembly is \$2,400 plus an additional \$1,200 allowance for expenses. The Leader of the Opposition receives an additional \$3,000 and the Speaker receives an allowance of \$1,000 in addition to the regular indemnity.

Subsection 5.—Quebec

The Government of Quebec consists of a Lieutenant-Governor, an Executive Council, and a bicameral legislature—the Legislative Council and the Legislative Assembly. The Legislative Council has 24 members nominated for life by the Lieutenant-Governor in Council. The Legislative Assembly has 93 elected members and, like the Legislative Council, has the power to bring forward Bills relating to civil and administrative matters and to the amendment or repeal of existing laws. A Bill to be approved by the Lieutenant-Governor must have received the assent of both Houses. Only the Legislative Assembly can bring forward a Bill requiring the expenditure of public money. The maximum life of a Legislature is five years.

Salaries and allowances of the Premier, members of the Executive Council, Legislative Council and Legislative Assembly are fixed according to RSQ 1941, c. 7 and RSQ 1941, c. 4, as amended by 1952-53, c. 38 and 1957-58, c. 51. All members of Legislative Assembly and Legislative Council receive \$6,000 per annum as salary and \$2,000 by way of allowances; in addition, the Premier receives \$10,000 as salary, \$4,000 allowances and \$2,000 for lodging allowance; Ministers with Portfolio an additional \$8,000 as salary and \$2,000 allowances; Ministers without Portfolio an additional \$5,000 salary and \$2,000 allowances; the Leader of the Opposition in the Legislative Assembly \$6,000 as salary, \$2,000 allowances and \$2,000 for lodging allowance; and the Leader of the Government in the Legislative Council and the Leader of the Opposition in the Legislative Council each receives \$7,000 as salary, \$2,000 allowances and \$3,000 for office allowances.

Subsection 6.—Ontario

The Government of Ontario consists of a Lieutenant-Governor, an Executive Council and a House of Assembly. The House of Assembly, the single-chamber Legislature of the province, is composed of 98 members elected for a statutory term of five years.

Besides the regular departments of government, the Niagara Parks Commission, the Ontario Municipal Board, The Hydro-Electric Power Commission of Ontario, the Ontario-St. Lawrence Development Commission, the Ontario Northland Transportation Commission, the Liquor Control Board, the Liquor Licence Board, the Hospital Services Commission and The Water Resources Commission have been created.

Under the provisions of the Legislative Assembly Act (RSO 1950, c. 202, and amendments) each member of the Assembly is paid an annual indemnity of \$3,600 and an allowance of \$1,800 for expenses. In addition, the Speaker receives a special indemnity at the annual rate of \$3,000 and an expense allowance of \$2,000; the Chairman of the Committee of the Whole a special indemnity at the annual rate of \$1,000; and the Leader of the Opposition a special indemnity of \$3,000 and an annual allowance of \$2,000 for expenses. Each member of the Cabinet having charge of a department receives the ordinary indemnity as a member of the Legislature in addition to his salary as a Minister of the Crown. The salary provided in the Executive Council Act for the Premier is

\$14,000 and for a Cabinet Minister having charge of a department \$10,000. By the 1956 amendment, every Minister of the Crown in charge of a department, the Minister of the Crown who is a member of The Hydro-Electric Power Commission of Ontario, and the Leader of the Opposition receives a representation allowance of \$2,000 per annum. Each Minister without Portfolio, other than the Minister who is a member of The Hydro-Electric Power Commission, receives \$1,800 salary and \$900 representation allowance per annum, by amendments in 1959 to the Executive Council Act and the Legislative Assembly Act, respectively.

Subsection 7.—Manitoba

Besides a Lieutenant-Governor, Manitoba has an Executive Council at present composed of nine members and a Legislative Assembly of 57 members elected for a statutory term of five years.

The Premier of the province is paid a salary of \$10,000 per annum and each of the other members of the Cabinet \$8,000. Members of the Legislature are each paid an indemnity of \$2,000 and an expense allowance of \$1,000. The Leader of the Opposition is paid an additional amount of \$2,500 and the Speaker of the Legislature receives an amount double the indemnity and expense allowance of an individual member.

Subsection 8.—Saskatchewan

The Government of Saskatchewan consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. The statutory number of members of the Legislative Assembly is 53 (55 as of next General Election), elected for a maximum term of five years.

The Premier receives \$9,500 and each Cabinet Minister \$8,000 annually in addition to a sessional indemnity. The Leader of the Opposition receives \$5,000, the Speaker \$2,500 and the Deputy Speaker \$1,500. The sessional indemnity of a member of the Legislature is \$3,200 together with an expense allowance of \$1,600. Members for the three northernmost constituencies of Cumberland, Athabasca and Meadow Lake each receive a \$3,500 sessional indemnity and a \$1,750 expense allowance.

Subsection 10.—British Columbia

The Government of British Columbia has a Lieutenant-Governor, an Executive Council and a Legislative Assembly. The Legislative Assembly, elected for a statutory term of five years, has 52 members.

Each member of the Executive Council and the Legislative Assembly receives a sessional allowance of \$3,400 and \$1,000 for expenses. There is also paid to each member a living allowance of \$15 for each day's attendance at the session and for each Saturday, Sunday or holiday that intervenes between two sittings of the House; the allowance of \$15 in any session is not paid in respect of more than 40 days. Each member also receives an allowance of 25 cents per mile of the distance between his place of residence and the city of Victoria, reckoning such distance, going and coming, according to the nearest mail route. In addition, the Premier receives a salary of \$15,000 and each member of the Executive Council \$12,500. The Leader of the Opposition has a special allowance of \$3,500 for expenses, the Speaker receives a special allowance of \$3,500 and the Deputy Speaker an allowance of \$1,000.

¹ Minister not necessarily sworn in on date of appointment.

Subsection 11.—Yukon and Northwest Territories

Yukon Territory.—The Yukon was created a separate Territory in June 1898. Provision is made for a local government composed of a Chief Executive styled Commissioner and an elective Legislative Council of five members with a three-year tenure of office. The Commissioner administers the government under instructions from the Governor in Council or the Minister of Northern Affairs and National Resources. The Commissioner in Council has power to make ordinances dealing with the imposition of local taxes, sale of liquor, preservation of game, establishment of territorial offices, maintenance of prisons and municipal institutions, issue of licences, incorporation of companies, solemnization of marriage, property and civil rights, and generally all matters of a local nature in the Territory. The seat of local government is at Whitehorse, Yukon Territory.

TERRITORIAL COUNCIL

(Five members elected in 1958 for three years)

TERRITORIAL OFFICIALS

(As at Apr. 1, 1960)

Commissioner (Whitehorse).....	F. H. COLLINS
Superintendent of Works and Buildings.....	G. B. STARR
Registrar of Vital Statistics.....	H. J. TAYLOR

The Northern Administration Branch, Department of Northern Affairs and National Resources, has the responsibility for the general administration of the natural resources of the Yukon Territory, except game. The Department maintains three lands and mining offices at various points in the Territory. Other departments and agencies of the Federal Government, including the Department of Justice, the Royal Canadian Mounted Police, the Departments of National Defence, Citizenship and Immigration, Mines and Technical Surveys, National Revenue, Transport, Post Office, Agriculture, Fisheries, Public Works and the Unemployment Insurance Commission, also maintain offices in the Yukon Territory.*

Northwest Territories.—As reconstituted on Sept. 1, 1905, these comprise:—

- (1) all that part of Canada north of the Sixtieth Parallel of North Latitude, except the portions thereof within the Yukon Territory and the Provinces of Quebec and Newfoundland, and
- (2) the islands in Hudson Bay, James Bay and Ungava Bay, except those islands within the Provinces of Manitoba, Ontario and Quebec.

The Northwest Territories Act (RSC 1952, c. 331) provides for the appointment of a Commissioner to administer the government of the Territories under instructions given from time to time by the Governor in Council or the Minister of Northern Affairs and National Resources. As a matter of practice the appointment is held by the Deputy Minister of Northern Affairs and National Resources. For administrative purposes the Territories are divided into the provisional districts of Mackenzie, Keewatin and Franklin (Order in Council dated Mar. 16, 1918). The Northwest Territories Act, as amended, also provides for a Council of nine members, four of whom are elected in the Mackenzie District and five of whom are appointed by the Governor in Council. The Commissioner in Council has legislative powers respecting such matters as direct taxation, establishment and tenure of territorial offices, municipal institutions, controverted elections, licences, incorporation of companies, property and civil rights, administration of justice, game, education, hospitals and generally all matters of a local or private nature. The Council meets once each year in the Territories and at least once each year in Ottawa, which is the seat of government. The resources, except game, remain under the control of the Federal Government. The administration of legislation passed by the Commissioner in Council and the management of resources under federal legislation are carried on by the Northern Administration Branch of the Department of Northern Affairs and National Resources. Administrative offices are located in the Territories at Fort Smith, Yellowknife, Hay River and Inuvik.

COUNCIL OF THE NORTHWEST TERRITORIES

(As at Apr. 1, 1960)

Commissioner	R. G. ROBERTSON
Deputy Commissioner	W. G. BROWN
Members of the Council—	
Appointed	C. M. DRURY, H. M. JONES, W. G. BROWN, L. H. NICHOLSON (one vacancy)
Elected	K. LANG, J. W. GOODALL, R. C. PORRITT, E. J. GALL
Officers of the Council—	
Secretary	G. A. MacKINNON (acting)
Legal Adviser	E. R. OLSON

* Further information on officials of various Federal Government departments serving Yukon Territory may be obtained from the Director, Northern Administration Branch, Department of Northern Affairs and National Resources, Ottawa.

Section 3.—Municipal Government*

Municipal government in Canada is placed under the control of the provincial legislatures by the British North America Act, 1867. Thus the powers of municipalities are those delegated to them by statutes passed by their respective provincial governments, some of which apply to all municipalities within the province, some to a certain type or group, and many to one municipality only. Municipal powers are further defined by regulations issued (under the provisions of the Acts) by the provincial government departments charged with their supervision and control. In the Yukon and Northwest Territories some municipal powers have been assigned to certain localities by the Federal Government and the territorial councils.

While powers and responsibilities delegated to municipalities vary from province to province and even within a province, they are largely those of raising money locally, of borrowing, and of spending to provide local services. All provinces give financial assistance in some form, usually as subsidies or grants-in-aid of certain services administered by the municipalities, and often as loans on or guarantees of loans for capital projects. Retention or assumption of what are often regarded as municipal responsibilities is sometimes considered an indirect form of aid, as is the extension of taxing privileges into what may be commonly regarded as a provincial revenue field.

The major revenue source available to municipalities is property taxation. It is supplemented in varying degrees by taxation of personal property, business, persons (poll taxes), and tenants. In two provinces municipalities may levy an amusement tax, in three they may impose sales taxes on a limited basis, and in Quebec some cities have been granted the right to levy a general sales tax. Miscellaneous general revenue is derived from licences, permits, rents, concessions, franchises and fines. Most urban municipalities of any size operate utilities and enterprises for the provision of water and, in many instances, electricity, gas, transportation, telephone and other services. These sometimes provide surplus funds that may become available to help provide other municipal services. On the other hand, expenditures of municipalities often include provision for the deficits of utilities and enterprises.

In differing degree and with varying provincial assistance, municipalities are responsible for the following services: protection to persons and property through police and fire forces, courts and local gaols, and inspection services; roads and streets; sanitation; certain health and welfare services; and some recreation and other community services. Except in Quebec and Newfoundland and in a few minor localities where school authorities must raise funds for education not provided for by the province concerned, municipalities are responsible for levying and collecting local education taxes on property on behalf of the local schools, and often for borrowing capital funds for school construction. This stems from the traditional concept that education is a local responsibility, though it is now largely financed and administered by the provincial governments. Local administrative responsibility for education lies with boards of trustees separate from the councils that govern municipalities (except in Alberta; see p. 123).

In some localities, certain local services are administered by special district authorities encompassing a number of municipalities or parts of municipalities. These district authorities provide services, such as greater water and sewerage districts, drainage and irrigation districts, and health units, which elsewhere may be provided by the municipality directly or through a board or utility. They are, in effect, co-operative efforts or a modified form of metropolitan government. Metropolitan government is in existence in Toronto and partially in Montreal, and studies are under way for some other major cities.

* Prepared in the Public Finance and Transportation Division, Dominion Bureau of Statistics.

The following paragraphs describe municipal organization in each province as at Jan. 1, 1959. In Table 53, which gives the number of each type of municipality in each province, all fully incorporated cities, towns and villages are regarded as urban municipalities. It is difficult to apply arbitrary definitions, such as that which classifies as urban centres all places having a population of 1,000 or more persons.

Newfoundland.—The Province of Newfoundland has two cities—St. John's and Corner Brook. A number of the province's many settlements have been organized into 33 towns, four rural districts, three local improvement districts and 32 local government communities. The towns, rural districts and local improvement districts operate under the Local Government Act; towns and rural districts have elected councils and local improvement districts have appointed trustees. Local government communities established under the Community Councils Act in the smaller settlements have limited powers and functions. There are no rural municipalities in the usual sense. Thus, between 40 p.c. and 50 p.c. of the population of the province is now organized in some form of local authority but only about one-fifth of 1 p.c. of the total area is so governed. Municipalities are supervised by the Department of Municipal Affairs and Supply.

Prince Edward Island.—In this island province, one city and seven towns have been incorporated under special Acts and 16 villages have been established under the Village Services Act. There is no municipal organization for the remainder of the province though it is divided into school sections.

Nova Scotia.—Municipal organization in Nova Scotia covers the whole of the province. The two cities, Halifax and Sydney, operate under special charters and special legislation. Forty towns operate under the Town Incorporation Act but there are no municipalities incorporated as villages. Cities and towns are independent of counties. The rural area is divided into 18 counties which, in themselves, do not represent units of local government. However, 12 of these counties each comprise one municipality and the other six each comprise two municipalities, making a total of 24 rural municipalities. Supervision of municipalities is exercised through the Department of Municipal Affairs.

New Brunswick.—This province is divided into 15 counties which are incorporated municipalities and have direct powers of local self-government as rural municipalities, though certain of their powers often apply in both rural and urban municipalities. The six cities have special charters, and the 20 towns operate under the Towns Incorporation Act. There is one village and 54 local improvement district areas within the counties but outside the cities, towns and villages; these have been incorporated for the provision of limited municipal services. The Department of Municipal Affairs exercises supervision.

Quebec.—Municipal divisions in Quebec embrace the more thickly settled areas comprising about one-third of the province and the remainder is governed by the province as "territories". The organized area is divided into 74 county municipalities which are divided again into local municipalities and designated as village, township or parish municipalities or simply as municipalities. The counties as such have no direct powers of taxation. Funds to finance the services falling within their jurisdiction are provided by the municipalities forming part thereof. Parts of some counties are not yet organized into incorporated units of local government, being in outlying areas with little or no population. There are 336 villages and 1,119 townships and parishes. A small number of these are independent of the counties in which they are located. The Municipal Code governs local municipalities, and the 54 cities and 160 towns have special Acts. The supervision and assistance of municipalities is through the Department of Municipal Affairs and the Quebec Municipal Commission. Municipal statistics are gathered by the Quebec Bureau of Statistics.

Functions of the Montreal Metropolitan Commission, established in 1921 to assist municipalities of greater Montreal which had experienced some degree of financial difficulty, were transferred at the end of 1959 to the Montreal Metropolitan Corporation; it is intended that, eventually, the Corporation will take on more of the functions of an over-all metropolitan administration.

The County of Laval was replaced in March 1959 by the Interurban Corporation of Île Jésus in order to facilitate solution of inter-municipal problems on the island.

Ontario.—Slightly more than one-tenth of the area of Ontario is municipally organized and the remainder is governed entirely by the provincial government. The older settled section of the province is divided into 43 counties, five of which are united with others for administrative purposes. Each county, although it is an incorporated municipality, is comprised of the towns, villages and townships situated within its borders, and these provide its revenue. The Municipality of Metropolitan Toronto encompasses one city, four towns, three villages and five townships. There are 30 cities, 157 towns, 154 villages, 573 townships and 24 improvement districts in the province. Some of each are located in the northern districts which are not organized into counties. Supervisory control of municipalities is exercised by the Department of Municipal Affairs and the Ontario Municipal Board under the Municipal Act and other Acts governing aspects of municipal government.

Manitoba.—Manitoba has six cities, which derive their powers from special Acts and do not come under the supervision of the Department of Municipal Affairs. The Department supervises the 35 towns, 37 villages and 112 rural municipalities under the Municipal Act. There are local government districts in settled areas not within rural municipalities.

Saskatchewan.—All municipalities in Saskatchewan derive their powers from general Acts that are designated with the name of the type of municipality. There are 10 cities, 104 towns, 371 villages and 296 rural municipalities. The area so organized consists of most of the southern two-fifths of the province—the remainder of this portion is administered for local purposes by the province in unincorporated local improvement districts. The northern three-fifths is sparsely populated and without local government, though some municipal services are provided by the province through operation of the Northern Administrative Area. Municipalities are supervised by the Department of Municipal Affairs.

Alberta.—The province has an Act applying to each type of municipality, and under these Acts the Department of Municipal Affairs supervises the nine cities, 86 towns, 156 villages, 38 municipal districts and 12 counties. The latter administer schools as well as municipal services.

British Columbia.—Less than one-half of 1 p.c. of the area of British Columbia is organized into municipalities. Additional small areas have sufficient population to require administration of local activities by the provincial government. There are 32 cities, three towns, 60 villages, and 30 districts; the latter are chiefly rural municipalities, except for those adjacent to the principal cities of Victoria and Vancouver which are largely urban in character. It should be emphasized, however, that the application of the name "city" is somewhat different from the commonly accepted meaning, in that several of them have populations of fewer than 1,000 and perhaps one-half or more would not normally be incorporated as cities in another province. Legislation of 1957 provided

for the incorporation of towns; by the beginning of 1959 three villages had attained town status and three cities had reverted to village status. Municipalities are supervised by the Department of Municipal Affairs.

Yukon and Northwest Territories.—There are two cities and one town in the Yukon Territory and two local administrative districts in the Northwest Territories, all of which provide some municipal services to their local areas. These are not shown in Table 53.

53.—Official Designation and Statistical Classification of Municipalities, by Province, as at Jan. 1, 1959

¹ Municipalities grouped according to their official nomenclature, which is roughly indicative of size and nature (see footnote 6). ² Municipalities grouped under the classification devised by the Dominion-Provincial Conferences on Municipal Statistics, designed to bring municipalities into comparable groups for statistical presentation.

³ Excludes 54 local improvement districts. ⁴ Designated by the province as towns (33), rural districts (4), and local improvement districts (3); all operate under the same Act. ⁵ Classified by the province as "community councils". ⁶ Rural municipalities are designated by different names in the different provinces.

⁷ Includes 24 improvement districts. ⁸ Includes 3 units of self-government known as "suburban municipalities"; excludes local government districts. ⁹ Excludes 12 local improvement districts. ¹⁰ Includes 12 county municipalities; excludes 50 improvement districts and two special areas. ¹¹ Excludes 2 local districts.

¹² The County of Laval has been replaced by the Interurban Corporation of Ile Jésus (see text). ¹³ Includes Municipality of Metropolitan Toronto. ¹⁴ Includes municipalities shown wholly or partly in metropolitan areas by 1956 Census revised to take care of later annexations, etc.; excludes the Municipality of Metropolitan Toronto.

¹⁵ Classified by province as suburban and semi-urban.

Section 4.—Federal and Provincial Royal Commissions

Federal Royal Commissions.—Royal Commissions established from Jan. 31, 1958 to Jan. 31, 1960 under Part I of the Federal Inquiries Act are given here in continuation of those previously reported in the Year Books beginning with the 1940 edition, pp. 1108-1110. Any Commissions established between Jan. 31, 1960 and the date of going to press will be found in an Appendix to this volume.

<i>Nature of Commission</i>	<i>Commissioner</i>	<i>Date Established</i>
To inquire into the desirability of establishing a new band of Indians on Seabird Island, B.C.	GEORGE L. CASSADY.....	Mar. 12, 1958
To inquire into and report upon the problems relating to railway transportation in Canada.	Hon. CHARLES P. McTAGUE (later succeeded by MURDOCH ALEXANDER MACPHERSON).	June 8, 1959
To inquire into the respective merits of alternate routes for a railway line from northern Alberta to southern portion of the District of Mackenzie, N.W.T.	MARSHALL E. MANNING.....	June 22, 1959
To inquire into the coal industry.....	Hon. IVAN CLEVELAND RAND.....	Oct. 23, 1959

Provincial Royal Commissions.—The following list of Provincial Royal Commissions established is in continuation of those appearing in previous Year Books beginning with the 1948-49 edition.

<i>Province and Nature of Commission</i>	<i>Commissioner or Chairman</i>	<i>Date Established</i>
NOVA SCOTIA		
To make public inquiry under the Rentals Act.	Hon. GEORGE M. MORRISON.....	Apr. 14, 1959
To inquire into the Springhill mine disaster....	DONALD McINNIS.....	Dec. 12, 1958
To inquire into the Nova Scotia Elections Act.	His Hon. Judge RALPH H. SHAW....	Aug. 7, 1959
NEW BRUNSWICK		
To study the coal resources of the Province of New Brunswick.	WILLIAM Y. SMITH.....	Oct. 17, 1958
MANITOBA		
To inquire into and investigate all negotiations, transactions and matters in connection with the acquiring of interests in petroleum, natural gas and related hydrocarbons, etc.	WINSTON EWART NORTON.....	Mar. 11, 1959
To inquire into the economic and social consequence of the colouring of margarine, similar to butter, etc.	WILLIAM J. WAINES.....	Oct. 14, 1959
BRITISH COLUMBIA		
To inquire into the rate structure, etc., of the British Columbia Power Commission.	GORDON MERRITT SHRUM.....	Nov. 21, 1958
To examine the transcript of evidence given in connection with the application of Empire Mills Limited of Squamish for a tree-farm licence; to make further inquiry and report upon the question: "Should the area applied for by Empire Mills Limited, Squamish, be managed under a tree-farm licence?"	His Hon. Judge CHARLES WILLIAM MORROW.	July 27, 1959

PART III.—ADMINISTRATIVE FUNCTIONS OF THE FEDERAL GOVERNMENT*

A special article presenting information on the administration and control of the financial affairs of the Federal Government appears in the 1956 Year Book at pp. 101-107.

Section 1.—Departments, Boards, Commissions, etc.

The following paragraphs indicate the functions of the various departments of government and the special boards and commissions in connection with the work of government.

Though it is not possible, owing to the limitations of space, to enumerate in this Section the details of each service or the divisions or sections of all departments, the main branches are given along with those services that differ in some quality from the larger class of subjects handled by a department. The work of many of these departments and boards is given in detail in later Chapters of this volume. The Index will be useful in locating required information.

Department of Agriculture.—This Department was established in 1867 (SC 1868, c. 53) and undertakes work on all phases of agriculture. Research and experimentation are carried out by the Research Branch; the maintenance of standards and protection of products by the Production and Marketing Branch; reclamation and development by the Prairie Farm Rehabilitation Administration and the Maritime Marshland Rehabilitation Administration; security and price stability policies are administered under the Prairie Farm Assistance Administration and Agricultural Stabilization Board. The Farm Credit Corporation which succeeded the Canadian Farm Loan Board on Oct. 5, 1959 is responsible to Parliament through the Minister of Agriculture.

Air Transport Board.—The Air Transport Board was established in 1944 by amendment of the Aeronautics Act. The Board is responsible for the economic regulation of commercial air services in Canada. The regulatory function relates to Canadian air services within Canada and abroad, and to foreign air services operating into Canada. It involves the licensing of all such services and the subsequent regulation of the licensees in respect of their economic operation and the provision of service to the public. The Board reports to Parliament through the Minister of Transport.

Auditor General's Office.—This Office originated in 1878 (SC 1878, c. 7) and currently functions under the Financial Administration Act (RSC 1952, c. 116). The Auditor General is responsible for examining accounts relating to the Consolidated Revenue Fund and to public property, and for reporting annually to the House of Commons the results of his examinations. He also audits the accounts of various Crown corporations and other instrumentalities.

Board of Broadcast Governors.—This Board was established pursuant to the Broadcasting Act assented to on Sept. 6, 1958 and is responsible for the regulation of radio and television broadcasting in Canada. This regulatory function includes the establishment and operations of networks of broadcasting stations, the activities of public and private broadcasting stations in Canada and the relationship between them. Applications for licences to establish new broadcasting stations and for changes in conditions of existing licences or changes in the ownership or share structure of licensees are referred to the Board by the Department of Transport for a recommendation to the Minister of Transport. The Board consists of three full-time members and twelve part-time members and reports to Parliament through the Minister of National Revenue.

Board of Grain Commissioners.—Constituted in 1912 under the Canada Grain Act, now the Canada Grain Act, 1930 (RSC 1952, c. 25), the Board of Grain Commissioners provides general supervision over grain handling in Canada by licensing elevator operators, inspecting and weighing grain en route to and shipped from terminal elevators, and other services. The Board, comprising a Chief Commissioner and two Commissioners, has authority to inquire into any matter relating to the grading and weighing of grain, deductions for dockage or shrinkage, deterioration of any grain during storage or treatment, unfair or discriminatory operation of a grain elevator, etc. The Board publishes its regulations in the *Canada Gazette* and reports to Parliament through the Minister of Trade and Commerce.

Board of Transport Commissioners.—The powers of this Board, which was organized as the Board of Railway Commissioners in 1904, have been extended from time to time until today it has regulatory and judicial functions dealing with almost all aspects of railway activity including

* As at Oct. 31, 1959; any changes taking place between that date and the date of going to press will be carried in an Appendix to this volume and in the accompanying chart showing the organization of the Government of Canada.

location, construction and operation of lines, rates and charges. It is also entrusted with the regulation of other transportation and communication agencies, including express companies, telegraph companies, telephone companies other than those provincially or municipally controlled, international bridges and tunnels and inland shipping. The Board reports to Parliament through the Minister of Transport.

Canadian Government Specifications Board.—This is an interdepartmental body composed of the Deputy Heads of 24 Federal Government departments and agencies. The Board operates under the auspices of the National Research Council, through the medium of committees in which government and industry co-operate on a voluntary basis. The Board prepares specifications in commodity fields and for materials, processes and equipment required by government agencies, and arranges for necessary testing and research. An Index of Specifications is available on request to the CGSB Secretary, National Research Council, Ottawa.

Chief Electoral Office.—This Office was established in 1920 under the provisions of the Dominion Elections Act, now the Canada Elections Act (RSC 1952, c. 23), and amendments thereto, and is responsible for the conduct of all federal elections as well as the elections of members of the Northwest Territories Council and of the Yukon Territory Council. In addition it conducts any vote taken under the Canada Temperance Act. The Chief Electoral Officer reports to Parliament through the Secretary of State.

Department of Citizenship and Immigration.—This Department was constituted in December 1949 (RSC 1952, c. 67) and came into existence on Jan. 18, 1950 under the Minister of Citizenship and Immigration. Most departmental work is carried on through four branches. The Canadian Citizenship Branch assists governmental and non-governmental agencies engaged or interested in facilitating the adjustment and integration of newcomers and in making Canadians conscious of their privileges and responsibilities as citizens. The Canadian Citizenship Registration Branch administers the Canadian Citizenship Act and is the custodian of all records under that Act and all Naturalization Acts previously in force. The Immigration Branch administers the Immigration Act and Regulations and is responsible for the selection, examination and movement of immigrants, the exclusion or deportation of undesirables and the settlement or establishment of immigrants in Canada. The activities of the Indian Affairs Branch include management of all Indian affairs. Its organization consists of a headquarters office at Ottawa, a regional supervisory staff, and 89 local agencies in the field.

The Minister of Citizenship and Immigration is responsible to Parliament for the National Film Board, the National Library, the Public Archives, and the National Gallery of Canada.

Civil Service Commission.—The Civil Service Commission of Canada dates from the Civil Service Act of 1903. Under this Act the Commission was given the responsibility of applying, wherever possible, the principle of appointment by merit in filling permanent positions within departmental headquarters positions at Ottawa, termed the 'inside service'.

The Civil Service Act, 1918 extended the competitive system of appointments to cover the outside as well as the inside service and temporary as well as permanent appointments. It made the Commission responsible for establishing a system of organization and classification that would secure uniformity in the staffing of the various departments and in the salaries paid for work of equal levels of difficulty and responsibility.

The jurisdiction of the Commission now extends to all departments of the Federal Government and to a large number of boards and commissions, exclusive of Crown corporations.

The Civil Service Commission, which is responsible not to the executive government but only to Parliament, consists of three members, one of whom serves as chairman. Each member of the Commission is appointed by the Governor in Council for a term of ten years and each has the rank and standing of a Deputy Minister. The Commission has a staff of approximately 660 persons located in the headquarters office at Ottawa and in district offices at St. John's, Nfld., Halifax, N.S., Saint John, N.B., Montreal, Que., Toronto, Ont., Winnipeg, Man., Regina, Sask., Edmonton, Alta., and Vancouver, B.C.

Department of Defence Production.—This Department was established on Apr. 1, 1951 under the provisions of the Defence Production Act (RSC 1952, c. 62, as amended). Under this Act the Minister is given, with certain exceptions, authority to buy defence supplies and construct defence projects required by the Department of National Defence. The Minister may, if authorized by the Governor General in Council, undertake for an associated government anything he may undertake for the Canadian Government. In addition, all powers, duties and functions that theretofore were vested in the Minister of Trade and Commerce under any contract, agreement, lease or other writing entered into pursuant to the Department of Munitions and Supply Act, 1939, or the Defence Supplies Act, 1950, are vested in the Minister of Defence Production.

Broadly, the Department's functions are to procure military goods, to construct defence installations and to organize industry for defence as required on behalf of the Department of National Defence, other government departments, and associated governments; to promote the expansion of defence production facilities and the development of defence-supporting industries particularly

of strategic resources important for the defence of Canada and its allies; and to ensure adequate supplies of essential materials and services for defence requirements. The main procurement units of the Department are six production branches—Aircraft, Ammunition, Electronics, Gun, Machine Tool and Shipbuilding—and a General Purchasing Branch. Major offices for foreign procurement are located at London, England, and Washington, U.S.A.; the General Purchasing Branch has 14 district purchasing offices located throughout Canada for local or urgent procurement. In addition, there are various service branches which include Administration, Comptroller's, Economics and Statistics, Financial Adviser's, Industrial Security, Legal, and Secretary's.

The following Crown companies report to Parliament through the Minister of Defence Production: Canadian Arsenals Limited, Canadian Commercial Corporation, Crown Assets Disposal Corporation, Defence Construction (1951) Limited, and Polymer Corporation Limited.

Dominion Bureau of Statistics.—The Dominion Bureau of Statistics was set up by statute in 1918 as a central statistical department for Canada (SC 1918, c. 43). In 1948 this statute, which had been consolidated as the Statistics Act (RSC 1927, c. 190), was repealed and replaced by the Statistics Act (RSC 1952, c. 257); it was amended by SC 1952-53, c. 18, assented to Mar. 31, 1953.

The function of the Dominion Bureau of Statistics is to compile, analyse and publish statistical information relative to the commercial, industrial, financial, social and general condition of the people and to conduct a census of population and agriculture of Canada as required under the Act.

The Bureau is a major publication agency of the Federal Government; the subjects of its reports cover all aspects of the national economy. The administrative head of the Bureau is the Dominion Statistician who reports to Parliament through the Minister of Trade and Commerce.

Department of External Affairs.—This Department was established in 1909 by "An Act to create a Department of External Affairs" (RSC 1952, c. 68). Its main function is the protection and advancement of Canadian interests abroad. The head of the Department of External Affairs is the Secretary of State for External Affairs. The senior permanent officer of the Department is the Under-Secretary (Deputy Minister) who is the chief adviser to the Secretary of State for External Affairs. He is assisted by a Deputy Under-Secretary and by four Assistant Under-Secretaries, one of whom is Legal Adviser, and is advised by officers in charge of the various divisions, each responsible for a part of the work of the Department. The divisional heads are assisted by Foreign Service Officers, Administrative Officers and by an administrative staff. Officers serving abroad are formally designated as High Commissioners, Ambassadors, Ministers, Counsellors, First, Second, Third Secretaries and Attachés at diplomatic posts and as Consuls General, Consuls and Vice-Consuls at consular posts. About 65 diplomatic and consular posts are maintained abroad.

The work of the Department at Ottawa is performed by 20 divisions, which may be grouped according to their functions into three categories—political, functional and administrative. There are five political divisions—American, Commonwealth, European, Middle Eastern and Far Eastern; ten functional divisions—Communications, Consular, Defence Liaison (1) and (2), Economic (1) and (2), Information, Legal, Historical Research and Reports, Protocol and United Nations; and four administrative divisions—Administrative Services, Finance, Personnel, and Supplies and Properties. There are also three smaller sections—Inspection Service, Political Co-ordination Section and the Press Office.

Department of Finance.—This Department, created on June 22, 1869 by an Act respecting the Department of Finance (SC 1869, c. 4), is under the authority of the Minister of Finance. The Department is responsible for the financial administration of Canada including raising the money required for the various governmental activities by way of taxation or borrowing. The Comptroller of the Treasury, an officer of the Department, is responsible for all Government disbursements. The work of the Department is organized in six principal divisions: Administration, Economic and International Affairs, Federal-Provincial Relations, Farm Improvement Loans, Taxation and Treasury Board. The Royal Canadian Mint is a branch of the Department and the Inspector General of Banks is an officer of the Department.

The Tariff Board is responsible to Parliament through the Minister of Finance.

Department of Fisheries.—The Department of Fisheries was first organized under a Minister of Fisheries in 1930. Prior to that date the federal fisheries services were maintained by the former Department of Marine and Fisheries, established in 1868. The provinces, under various arrangements, have certain administrative responsibilities in the fisheries but the legislative authority for the regulations of coastal and freshwater fisheries is with the federal Department of Fisheries.

The work of the Department includes: conservation and development of the fisheries through the enforcement of fishing regulations, the operation of fish culture establishments, management and improvement of spawning streams and control of predators; inspection of fish products for quality control and the encouragement of industrial development; promotion of the greatest utilization of fishery products and a proper public understanding of the resource and the industry. The Department administers the Fishermen's Indemnity Plan to assist fishermen in the event of loss or serious damage to their fishing vessels or lobster traps.

Agencies connected with the Department are the Fisheries Prices Support Board and the Fisheries Research Board of Canada. The Department is represented on the following international commissions: Pacific Salmon Fisheries, Pacific Halibut, the Northwest Atlantic Fisheries, North Pacific Fisheries, Whaling, and Great Lakes Fishery, and participates in an international agreement controlling the take of Pribilof seals.

Fisheries Research Board.—The Fisheries Research Board operates under the Fisheries Research Board Act of 1937 (amended in 1947 and 1952-53). It has been active as a fisheries research body since 1898, first as the Board of Management of the Canadian Marine Biological Station and later (1912) as the Biological Board of Canada.

The Board operates under the Minister of Fisheries and membership consists of a full-time chairman and up to 18 members appointed by the Minister from among leading Canadian scientists and business men with a knowledge of fishery problems, and senior officers of the Department of Fisheries.

The Board operates five biological stations across Canada, three technological stations with two application units and two oceanographic groups. It serves as the scientific arm of the Department of Fisheries and its principal objective is to increase the scope and value of Canadian fisheries through scientific research.

Department of Insurance.—The Minister of Finance is responsible for the Department of Insurance which originated in 1875 as a branch of the Department of Finance but was constituted a separate Department in 1910. It is authorized and governed by the Department of Insurance Act (RSC 1952, c. 70). Under the Superintendent of Insurance, the Department administers the statutes of Canada applicable to: insurance, trust and loan companies incorporated by the Parliament of Canada; provincially incorporated insurance companies registered with the Department; British and foreign insurance companies operating in Canada; small loans companies and money-lenders; co-operative credit societies registered under the Co-operative Credit Associations Act; and Civil Service insurance.

Under the relevant provincial statutes the Department examines provincial trust companies in the Provinces of Manitoba and New Brunswick and loan and trust companies in the Province of Nova Scotia.

International Joint Commission.—This Commission was established under a Great Britain-United States treaty, Jan. 11, 1909, ratified by Canada in 1911. The Commission, composed of six members (three appointed by the President of the United States and three by the Government of Canada) is governed by five specific Articles of the Boundary Waters Treaty of 1909. The Commission's approval is required for any use, obstruction or diversion of boundary waters affecting the natural level or flow of boundary waters in the other country; and for any works in waters flowing from boundary waters or below the boundary in rivers flowing across the boundary which raise the natural level of waters on the other side of the boundary.

Problems arising along the common frontier are also referred to the Commission by either country for examination and report, such report to contain appropriate conclusions and recommendations. In addition, questions or matters of difference between the two countries may be referred to the Commission for decision, provided both countries consent.

The Commission reports to the Secretary of State for External Affairs of Canada and to the Secretary of State of the United States.

Department of Justice.—This Department, established by SC 1868, c. 39, now operates under authority of the Department of Justice Act (RSC 1952, c. 71). It provides legal services to the Government and various government departments including preparing and settling government legislation, settling instruments issued under the Great Seal of Canada, regulating and conducting litigation for or against the Crown, superintending the acquisition of property and prosecutions under federal legislation other than the Criminal Code, administers federal statutes dealing with legal matters and provides administrative services for the Supreme Court of Canada and the Exchequer Court. The Department also superintends the penitentiaries and administers the prison system of Canada.

The Commissioner of the Royal Canadian Mounted Police operates under the direction of the Minister of Justice who also reports to Parliament for the National Parole Board.

Department of Labour.—The Department of Labour was established in 1900 by Act of Parliament (SC 1900, c. 24) and now operates under authority of the Department of Labour Act (RSC 1952, c. 72). The Department administers, under the Minister of Labour, legislation dealing with: industrial relations, investigation of disputes, etc.; fair employment practices; the regulation of fair wages and hours of labour; reinstatement in civil employment; female employee equal pay; government annuities; government employee compensation; merchant seamen compensation; vocational training; annual vacations with pay. It promotes joint consultation in industry through labour-management committees; provides co-ordination of services for rehabilitation of disabled civilians; organizes manpower utilization programs, e.g., farm labour; and operates a Women's Bureau. The Department publishes the *Labour Gazette* and other publications, as well as general information on labour-management, employment, manpower and related subjects.

The Canada Labour Relations Board acts on behalf of, and the Vocational Training Advisory Council acts in an advisory capacity to the Minister of Labour, and the Merchant Seamen Compensation Board reports to the Minister of Labour. The Department is the official liaison agency between the Canadian Government and the International Labour Organization.

The Unemployment Insurance Commission, which maintains the National Employment Service, reports to the Minister of Labour.

Department of Mines and Technical Surveys.—This Department was created by an Act of Parliament (SC 1949, c. 17) which received Royal Assent on Dec. 10, 1949. Its establishment resulted from the reorganization of certain former departments. A primary function of the Department is to provide technological assistance in the development of Canada's mineral resources through investigations and research in the fields of geology, mineral dressing and metallurgy. The Department establishes the framework of surveys throughout the country that provides control for all surveying and mapping in Canada. It produces the base maps used in the development of Canada's natural resources, conducts all the charting of Canada's coastal and inland waters, and issues official sailing directions and Canadian sea and air navigation charts. The Department is under the Minister of Mines and Technical Surveys and is divided into five branches: the Surveys and Mapping Branch, the Geological Survey of Canada, the Mines Branch, the Dominion Observatories, and the Geographical Branch. The Mineral Resources Division, a unit of head office, gives its whole attention to matters concerned with the economics of mineral resources development.

The Department administers the Explosives Act which regulates the manufacture, testing, sale, storage and importation of explosives, and the Emergency Gold Mining Assistance Act which provides cost-aid to the Canadian gold mining industry.

Boards and Commissions are: Canadian Board on Geographical Names; Board of Examiners for Dominion Land Surveyors; the International Boundary Commission and Interprovincial Boundary Commissions.

Department of National Defence.—The Department of National Defence was established on Jan. 1, 1923 by the Department of National Defence Act, 1922, and was an amalgamation of the Department of Militia and Defence, the Naval Service and the Air Board. The Department and the Canadian Forces (the Royal Canadian Navy, the Canadian Army and the Royal Canadian Air Force) now operate under the National Defence Act, 1950 (RSC 1952, c. 184).

In 1940 additional Ministers for Naval and Air Services were appointed and the Department was organized under a Minister of National Defence and two additional Ministers so that there was a Minister and staff for each of the Armed Services. Upon demobilization of the wartime Forces the appointment of Ministers of National Defence for Naval Services and Air Services ceased, and the Armed Forces were, in 1946, again administered by the Minister of National Defence without additional Ministers. Under the National Defence Act, the Canadian Forces are being administered solely by the Minister of National Defence and the Associate Minister of National Defence.

The Defence Research Board, created in 1947 to carry out research relating to national defence and to advise the Minister on all relevant matters of a scientific or technical nature, now functions under the National Defence Act. The Chairman of the Board has a status equivalent to that of a Chief of Staff of one of the Canadian Forces.

National Film Board.—The National Film Board, established in 1939, operates under the National Film Act (RSC 1952, c. 185) which provides for a Board of Governors of nine members—a Government Film Commissioner, appointed by the Governor in Council, who is Chairman of the Board, three members from the public service of Canada and five members from outside the public service. The Board reports to Parliament through a designated Minister of the Crown (at present the Minister of Citizenship and Immigration). The Board is responsible for advising the Governor in Council on film activities and is authorized to produce and distribute films in the national interest and, in particular, films "designed to interpret Canada to Canadians and to other nations".

Department of National Health and Welfare.—This Department was established in October 1944 under authority of the Department of National Health and Welfare Act (RSC 1952, c. 74). It was originally formed as the Department of Health in 1919 and later became part of the Department of Pensions and National Health. This Department was replaced in 1944 by the Department of National Health and Welfare and the Department of Veterans Affairs.

The Department, headed by the Minister of National Health and Welfare, is composed of three branches—Administration, Health, and Welfare—and is administered by two Deputy Ministers.

The Department has charge of all matters relating to the promotion or preservation of the health, social security and social welfare of the people of Canada over which the Federal Parliament has jurisdiction. It administers the Acts listed in Section 3, p. 143, and is also responsible for: the administration of the National Health Program under which grants are made available to the provinces for the development and extension of health services; the federal aspects of emergency health and welfare services; the provision of health, medical and hospital services to Indians and Eskimos and to other elements of the population in the Yukon and Northwest Territories; the provision of assistance and consultative services to the provinces upon request on blindness control, child and maternal health, mental health, dental health, nursing, medical rehabilitation, nutrition and hospital design; the inspection and medical care of immigrants and seamen and the administration of marine hospitals; the supervision of public health facilities on railway, water and other

forms of transportation; the enforcement of regulations of the International Joint Commission relating to public health; the promotion and conservation of the health of civil servants and other government employees; the collection, publication and distribution, subject to the provisions of the Statistics Act, of information relating to public health, improved sanitation and social and industrial conditions affecting the health of Canadians.

National Library.—As a result of the National Library Act proclaimed Jan. 1, 1953, the National Library superseded the Canadian Bibliographic Centre. It continues to publish *Canadiana*, a monthly list of new publications relating to Canada, with a yearly cumulation. The Library also publishes other bibliographies. Its Reference Division maintains the National Union Catalogue which embodies the catalogues of the major libraries in the ten provinces and is a key to the book collections in the whole country. The National Librarian reports to the Minister of Citizenship and Immigration.

National Parole Board.—The establishment of the National Parole Board, which was formed in January 1959, is authorized by the Parole Act (SC 1958, c. 38) by which it is given absolute jurisdiction over all matters of parole. It is composed of a chairman and three members appointed by Order in Council for a ten-year period. The Board reports to Parliament through the Minister of Justice.

Department of National Revenue.—From Confederation until May 1918, customs and inland revenue Acts were administered by separate departments; after that date they were amalgamated under one Minister as the Department of Customs and Inland Revenue. In 1921 the name was changed to the Department of Customs and Excise. In April 1924 collection of income taxes was placed under the Minister of National Revenue and, under the Department of National Revenue Act, 1927, the Department became known as the Department of National Revenue.

The Customs and Excise Division of the Department is responsible for the assessment and collection of customs and excise duties as well as sales and excise taxes, by ports and outposts. The Taxation Division is responsible for the assessment and collection of income taxes and estate taxes by 29 district offices throughout Canada.

The Minister of National Revenue is responsible to Parliament for the Income Tax Appeal Board and also reports to Parliament for the Canadian Broadcasting Corporation and the Board of Broadcast Governors.

Department of Northern Affairs and National Resources.—The Department of Northern Affairs and National Resources was established in December 1953, superseding the Department of Resources and Development. In addition to Administration Services, which performs auxiliary functions, the Department is divided into seven branches: the National Parks Branch administers the National Parks and National Historic Parks of Canada, National Historic Sites, and wildlife matters coming within the jurisdiction of the Federal Government; the Water Resources Branch is responsible for the investigation of water power resources, for the administration of federal assistance to the provinces under the Canada Water Conservation Assistance Act and for federal interests in certain joint federal-provincial construction projects; the Northern Administration Branch is responsible for the administration of various federal Acts, territorial ordinances and regulations pertaining to the government of the Northwest Territories, for the conduct of certain business arising from the general administration of the Yukon Territory, for the administration of natural resources in those Territories, and for Eskimo affairs, as well as for certain lands and mineral rights in the provinces vested in the Crown in the right of Canada; the Forestry Branch conducts investigations in the protection and utilization of the forest resources of Canada, maintains forest experiment stations and forest products laboratories and administers federal assistance to the provinces under the Canada Forestry Act; the Natural History Branch and Human History Branch of the National Museum of Canada are responsible for research, publication of scientific studies, and public exhibitions in their respective fields of natural history and human history; and the Canadian Government Travel Bureau promotes the tourist industry by encouraging tourist travel in Canada.

The Minister of Northern Affairs and National Resources is also responsible to Parliament for the Eastern Rockies Forest Conservation Board, the Northern Canada Power Commission, and the National Battlefields Commission. The Historic Sites and Monuments Board of Canada, an honorary body of recognized historians representing the various provinces, and the Advisory Board on Wildlife Protection act in an advisory capacity to the Minister in their respective fields. The Deputy Minister is Commissioner of the Northwest Territories.

Post Office Department.—Administration and operation of the Canada Post Office, by virtue of the Post Office Act (RSC 1952, c. 212) and under the Postmaster General, includes all phases of postal activity, personnel, mail handling, transportation of mails by land, water, rail and air and the direction and control of financial services including the operation of money order and savings bank business.

Public Archives.—The Public Archives was founded in 1872 and is administered under the Public Archives Act (RSC 1952, c. 222) by the Dominion Archivist who has the rank of a Deputy Minister and reports to Parliament through the Minister of Citizenship and Immigration. Its purpose is to assemble and make available to the public a comprehensive collection of historical source material relating to the history of Canada. Major emphasis is placed on official records

of the Government and the personal papers of political leaders and other prominent figures. These are supplemented by copies of many records in the British and French archives that relate to Canada, a fine map collection, a historical library, and many prints, paintings and photographs.

Department of Public Printing and Stationery.—This Department was established in 1886 and is in the charge of the Queen's Printer and Controller of Stationery.

The Department is responsible for supplying all requirements of printing and stationery to Parliament and departments of the Canadian Government; the cataloguing, distribution and sale of government publications; the publication of the *Canada Gazette*, and all departmental reports, papers, etc., required to be published by authority of the Governor General in Council (RSC 1952, c. 226) and the publication of the Statutes of Canada (RSC 1952, c. 230).

The Department of Public Printing and Stationery is under the jurisdiction of the Secretary of State.

Department of Public Works.—This Department was constituted in 1867 and operates under the legislative authority of the Public Works Act and other Acts of Parliament. It is responsible for the management and direction of the public works of Canada and, except as specifically provided in other Acts, attends to the construction and maintenance of public buildings, wharves, piers, roads and bridges and the undertaking of dredging and navigable waters protection work. The Department maintains district offices at key points across the country. The main operating Branches of the Department with headquarters in Ottawa are: Harbours and Rivers Engineering, Building Construction, Development Engineering, Property and Building Management, and Purchasing and Stores. In addition, the Fire Prevention Branch, organized in 1919 and now a part of the Department of Public Works, maintains fire-loss records, makes inspections, reports on fire protection legislation and protection methods and endeavours to extend and co-ordinate fire prevention work in Canada. Federal interests in the Trans-Canada Highway are also handled by the Department.

The Minister of Public Works is responsible to Parliament for the Central Mortgage and Housing Corporation and for the National Capital Commission.

Department of the Secretary of State.—The Secretary of State and Registrar General of Canada is the official medium of communication with the Throne through the Governor General, and is the custodian of the Great Seal of Canada and of the Privy Seal of the Governor General. He is responsible for the preparation and tabling of returns in Parliament. He administers legislation relating to patents of invention, trade marks, industrial designs, timber marking, copyright, companies, boards of trade, the registration of trade unions, public officers, public documents and governmental and parliamentary translations. He is also the Custodian of Enemy Property.

The Secretary of State has certain responsibilities with respect to civilian decorations, precedence and ceremonial. The Committee on the use of Parliament Hill and the National War Memorial falls within his purview. He is the Minister of the Department of Public Printing and Stationery and the spokesman in Cabinet and Parliament for the Civil Service Commission and the Chief Electoral Officer.

The Tariff Board.—Constituted in 1931 under the Tariff Board Act (SC 1931, c. 55), the Board derives its duties and powers from three statutes: the Tariff Board Act (RSC 1952, c. 261, as amended); the Customs Act (RSC 1952, c. 58, as amended); and the Excise Tax Act (RSC 1952, c. 100, as amended).

Under the Tariff Board Act, the Board makes inquiry into and reports upon any matter in relation to goods that, if brought into Canada, are subject to or exempt from duties of customs or excise taxes. Reports of the Board are tabled in Parliament by the Minister of Finance. It is also the duty of the Board to hold an inquiry under Sect. 14 of the Customs Tariff and to inquire into any other matter in relation to the trade and commerce of Canada that the Governor in Council sees fit to refer to the Board for inquiry and report.

Under the provisions of the Customs Act and the Excise Tax Act, the Tariff Board acts as a court to hear appeals from rulings of the Department of National Revenue, Customs and Excise, in respect of excise taxes, tariff classification, value for duty, and drawback of customs duties. Declarations of the Board on appeals on questions of fact are final and conclusive but the Acts contain provisions for appeal, on questions of law, to the Exchequer Court of Canada.

Department of Trade and Commerce.—The Department of Trade and Commerce was established by Act of Parliament on June 23, 1887, but did not function until Dec. 5, 1892, when an Order in Council to this effect was passed. Before the formation of the Department, assistance in the development of Canada's external trade was provided by eight Canadian Commercial Agents—five in the West Indies, two in Great Britain and one in France—who served on a part-time basis and were responsible to the Minister of Finance. In 1895 a Canadian Commercial Agent was appointed at Sydney, Australia, as the first full-time salaried Agent of the Department.

The framework of the present Trade Commissioner Service emerged during the next decade or so, the Commercial Agents gradually giving place to career Trade Commissioners. There are now 145 Trade Commissioners serving at Headquarters and abroad in 59 posts (including Assistant Trade Commissioners and agricultural, fisheries and timber specialists). Where Trade Commissioners are members of a mission maintained by the Department of External Affairs they hold diplomatic status and are known as Commercial Counsellors or Commercial Secretaries.

The Department provides a wide range of services to Canadian business men. It comprises: the Canadian Trade Commissioner Service, Commodities Branch (including the Transportation and Trade Services Division), Agriculture and Fisheries Branch, International Trade Relations Branch, Trade Publicity Branch, Industrial Development Branch, Small Business Branch, Economics Branch, Energy Studies Branch, Standards Branch, Economic and Technical Assistance Branch and the Canadian Government Exhibition Commission.

The following boards, commissions, Crown corporations and agencies report to Parliament through the Minister of Trade and Commerce—seven of them through his capacity as Chairman of the Privy Council Committee on Scientific and Industrial Research: Board of Grain Commissioners, Canadian Wheat Board, Dominion Bureau of Statistics, Export Credits Insurance Corporation, Northern Ontario Pipe Line Crown Corporation, National Energy Board, Atomic Energy Control Board, Atomic Energy of Canada Limited, Canadian Patents and Development Limited, National Research Council, Eldorado Mining and Refining Company Limited, Eldorado Aviation Limited, and Northern Transportation Company Limited.

Department of Transport.—The Department was created on Nov. 2, 1936 from the former Departments of Marine and of Railways and Canals, and the Civil Aviation Branch of the Department of National Defence (RSC 1952, c. 79).

The work of the Department consists of three main Services: Marine, Air and Railways. Marine Service operations include aids to navigation, nautical and pilotage services, marine agencies, secondary canals, steamship inspection and floating equipment, and direct supervision over 300 public harbours; nine other harbours come under supervision of the Department but are administered by commissions. Air Services cover the operation of civil aviation, meteorological and telecommunication branches. The latter includes the administration and regulation of radar, radio marine and radio aeronautical aids to navigation and of communication by wire and by government telegraph and telephone.

Other services of the Department are in connection with the Government-owned companies: the Canadian National Railways, Canadian Government Railways, the Prince Edward Island, Newfoundland, and Yarmouth-Bar Harbor ferry services, and Trans-Canada Air Lines.

The Minister of Transport is responsible to Parliament for the following boards, commissions and Crown companies: the Air Transport Board; Board of Transport Commissioners; Canadian Maritime Commission; National Harbours Board; Park Steamship Company Limited; the St. Lawrence Seaway Authority; and the Canadian Overseas Telecommunication Corporation.

Department of Veterans Affairs.—This Department, established in 1944 (RSC 1952, c. 80), is concerned exclusively with the welfare of veterans and with the dependants of veterans and of those who died on active service. The Department provides treatment services (hospital, medical, dental and prosthetic), welfare services, education assistance, life insurance, and land settlement and home construction assistance. The Veterans' Bureau assists veterans in the preparation and presentation of pension claims.

The Canadian Pension Commission, established by the Pension Act (RSC 1952, c. 207), and the War Veterans Allowance Board, established by the War Veterans Allowance Act (RSC 1952, c. 340), also report to Parliament through the Minister of Veterans Affairs.

The Department has treatment institutions and facilities in a number of centres of population. It also maintains administrative offices, shared by the Canadian Pension Commission and the War Veterans Allowance Board, in large cities across Canada and in London, England.

Emergency Measures Organization.—This Organization is a section of the Privy Council Office, established in June 1957 for the purpose of co-ordinating civil emergency planning. On Sept. 1, 1959, the Departments of National Defence, Health and Welfare, and Justice became responsible for specific civil defence functions; the Emergency Measures Organization for the residue. The Organization is responsible, through the Secretary of the Cabinet, to the Prime Minister.

National Energy Board.—This Board was established under the National Energy Board Act, 1959 for the broad purpose of assuring the best use of energy resources in Canada. The Board, composed of five members, is responsible for the regulation of the construction and operation of the oil and gas pipelines that are under the jurisdiction of the Parliament of Canada, the tolls charged for transmission by oil and gas pipeline, the export and import of gas and the export of electric power, and the construction of the lines over which such power is transmitted. The Board is also required to study and keep under review all matters relating to energy under the jurisdiction of the Parliament of Canada and to recommend such measures as it considers necessary and advisable on the subject. The Board reports to Parliament through the Minister of Trade and Commerce.

Royal Canadian Mounted Police.—The Royal Canadian Mounted Police, a civil force maintained by the Federal Government, was organized in 1873 as the North West Mounted Police. It now operates under the Royal Canadian Mounted Police Act 1959 and is responsible for enforcing federal laws throughout Canada. By agreement with certain provincial governments, it is also responsible for enforcing provincial laws within those provinces and for policing many district municipalities, cities and towns. The Force is controlled and administered by the Minister of Justice.

Section 2.—Crown Corporations

The Crown corporation form of public enterprise is not a new type of organization in Canada but in recent years, as the work of government has become more complex, greater reliance has been placed on it as the appropriate instrument for administering and managing many public services in which business enterprise and public accountability must be combined.

The use of the corporate device to harmonize public responsibility in the development of economic resources and the provision of public services with the pursuit of commercial and industrial objectives has led to the adoption of many different forms and formulas of management. The most usual practice has been to set up a corporation under the provisions of a special Act of Parliament which defines its purpose and sets forth its powers and responsibilities. However, during World War II the Minister of Munitions and Supply was authorized to procure the incorporation of companies under the federal Companies Act, 1934, or under any provincial Companies Act to which he might delegate any of the powers conferred on him under the Department of Munitions and Supply Act or any Order in Council. Under this legislation about 28 companies were created to serve a wide variety of purposes; most of these companies have since been wound up.

Following the successful experience during the war years in relying on the Companies Act for the establishment of Crown companies, similar incorporating powers were granted by an amendment to the Research Council Act and have been incorporated in the Atomic Energy Control and the Defence Production Acts.

In 1946 the Government Companies Operation Act was passed to regulate the operation of companies formed under the Companies Act. However, it was applicable only to a relatively small number of companies and, in order to establish a more uniform system of financial and budgetary control and of accounting, auditing and reporting for Crown corporations generally, Part VIII of the Financial Administration Act was enacted in 1951 and brought into operation by proclamation on Oct. 1, 1952. Upon its enactment the financial provisions of the Government Companies Operation Act were repealed.

One of the more interesting features of the later legislation is the attempt that has been made to define and classify Crown corporations.* The Act defines a Crown corporation as a corporation that is ultimately accountable, through a Minister, to Parliament for the conduct of its affairs and establishes three classes of corporation: departmental, agency and proprietary.

Departmental Corporations.—A departmental corporation is defined as a Crown corporation that is a servant or agent of Her Majesty in right of Canada and is responsible for administrative, supervisory or regulatory services of a governmental nature. Ten departmental corporations are listed in Schedule B to the Act:—

Agricultural Stabilization Board (formerly Agricultural Prices Support Board)
Atomic Energy Control Board
Canadian Maritime Commission
Director of Soldier Settlement
The Director, The Veterans' Land Act
Dominion Coal Board
Fisheries Prices Support Board
National Gallery of Canada
National Research Council
Unemployment Insurance Commission.

* Not all Crown corporations are subject to the provisions of the Financial Administration Act. For example, the Canadian Wheat Board, the Bank of Canada and its subsidiary the Industrial Development Bank, because of the special nature of their functions, are excluded from operations of the Crown corporations Part of the Act and are governed by their own Acts of incorporation, as are such joint enterprises of the federal and provincial governments as the Eastern Rockies Forest Conservation Board and the Halifax Relief Commission. Though not included in the Schedules to the Financial Administration Act, certain provisions of the Act apply to the Northern Ontario Pipe Line Crown Corporation, set up on June 7, 1956 to oversee the building of a cross-country natural gas pipeline. The Canada Council was set up under the Canada Council Act (assented to Mar. 28, 1957) as a Crown corporation but has been declared not an agency of the Crown and hence is not included in the Schedules to the Financial Administration Act.

Agency Corporations.—An agency corporation is defined as a Crown corporation that is an agent of Her Majesty in right of Canada and is responsible for the management of trading or service operations on a quasi-commercial basis or for the management of procurement, construction or disposal activities on behalf of Her Majesty in right of Canada. The following agency corporations are listed in Schedule C to the Financial Administration Act or have been subsequently added to that Schedule by the Governor in Council:—

- Atomic Energy of Canada Limited
- Canadian Arsenals Limited
- Canadian Commercial Corporation
- Canadian Patents and Development Limited
- Crown Assets Disposal Corporation
- Defence Construction (1951) Limited
- National Battlefields Commission
- Northern Canada Power Commission (formerly Northwest Territories Power Commission)
- National Capital Commission (formerly Federal District Commission)
- National Harbours Board
- Park Steamship Company Limited.

Two corporations, Canadian Sugar Stabilization Corporation Limited and Commodity Prices Stabilization Corporation Limited, listed in Schedule C when the Financial Administration Act was proclaimed, have since discontinued operations and surrendered their charters. By an Order in Council of June 15, 1955, the name of the Northwest Territories Power Commission (now Northern Canada Power Commission) was deleted from Schedule D and added to Schedule C, effective Apr. 1, 1954.

Proprietary Corporations.—A proprietary corporation is defined as a Crown corporation that (1) is responsible for the management of lending or financial operations, or for the management of commercial or industrial operations involving the production of or dealing in goods and the supplying of services to the public, and (2) is ordinarily required to conduct its operations without Parliamentary appropriations. The following proprietary corporations are listed in Schedule D to the Act or have been subsequently added to that Schedule by the Governor in Council:—

- Canadian Broadcasting Corporation
- Canadian National (West Indies) Steamships Limited
- Canadian Overseas Telecommunication Corporation
- Central Mortgage and Housing Corporation
- Eldorado Aviation Limited
- Eldorado Mining and Refining Limited
- Export Credits Insurance Corporation
- Farm Credit Corporation (formerly Canadian Farm Loan Board)
- National Railways, as defined in the Canadian National-Canadian Pacific Act, 1933
- Northern Transportation Company Limited
- Polymer Corporation Limited
- The St. Lawrence Seaway Authority
- Cornwall International Bridge Company Limited (subsidiary to the St. Lawrence Seaway Authority)
- Trans-Canada Air Lines.

Departmental corporations are governed by the provisions of the Financial Administration Act that are applicable to departments generally. Agency and proprietary corporations, however, are subject to the provisions of the Crown corporations Part of the Act although, if there is any inconsistency between the provisions of that Part and those of any other Act applicable to a corporation, the Act provides that the latter prevail. There is provision in the Part for the control and regulation of such matters as corporation budgets and bank accounts, the turning over to the Receiver General of surplus money, limited loans for working-capital purposes, the awarding of contracts and the establishment of reserves, the keeping and auditing of accounts, and the preparation of financial statements and reports and their submission to Parliament through the appropriate Minister.

A further form of control is exercised by Parliament through the power to vote financial assistance. This may take different forms. For some corporations, capital may be provided by parliamentary grants, loans or advances that may subsequently be converted into capital stock or bonds; for others it may be by the issue of capital stock to be subscribed and paid for by the Government; or by the sale of bonds to either the Government or the public. A few corporations have financed all or a portion of their requirements from their own resources or earnings. Under a special financing arrangement a 15-p.c. excise tax charged on radio and television sets and their parts and accessories was allocated to the revenue of the Canadian Broadcasting Corporation, but this was discontinued under the provisions of the Broadcasting Act which came into force on Nov. 10, 1958, and since that time the Corporation has received federal financing solely by parliamentary grants.

Prior to 1952, Crown corporations did not pay corporate income taxes. However, the Income Tax Act was later amended so that, in respect of financial years commencing after Jan. 1, 1952, proprietary Crown corporations pay taxes on income earned in the same manner as any privately owned corporation. One desirable result of this amendment is that the financial statements of these Crown companies are now more comparable with those of private industry, with which in some instances they are in competition, and thus it is easier to assess the relative efficiency of their operations.

The functions of the various Crown corporations are given briefly in the following paragraphs. For a number of them, further details are included in the Chapters dealing with the subjects concerned (see Index).

Agricultural Stabilization Board.—The Board was established in 1958 (SC 1957-58, c. 22) to administer the provisions of the Agricultural Stabilization Act, which has replaced the Agricultural Prices Support Act. The Board reports to Parliament through the Minister of Agriculture.

Atomic Energy Control Board.—In December 1946, by Act of Parliament (RSC 1952, c. 11), the regulation and control of atomic energy in Canada was placed under the Atomic Energy Control Board. The Board reports to Parliament through the Chairman of the Committee of the Privy Council on Scientific and Industrial Research (at present the Minister of Trade and Commerce).

Atomic Energy of Canada Limited.—This Crown company was incorporated in February 1952 under the Atomic Energy Control Act, 1946 (RSC 1952, c. 11) to take over from the National Research Council on Apr. 1, 1952 the operation of the Chalk River project. The main functions of the company are the research into many aspects of atomic energy, the operation of atomic reactors and the extraction, processing and marketing of the by-products of the reactors. The company reports to Parliament through the Chairman of the Committee of the Privy Council on Scientific and Industrial Research (at present the Minister of Trade and Commerce).

Bank of Canada.—Legislation of 1934 (RSC 1952, c. 13) provided for the establishment of a central bank in Canada, the function of which is to regulate credit and currency, to control and protect the external value of the Canadian dollar and to stabilize the level of production, trade, prices and employment so far as may be possible within the scope of monetary action. The Bank acts as the fiscal agent of the Government of Canada, manages the public debt and has the sole right to issue notes for circulation in Canada. The Bank is managed by a Board of Directors appointed by the Government and composed of a Governor, a Deputy Governor and 12 Directors; the Deputy Minister of Finance is also a member of the Board. The Bank reports to Parliament through the Minister of Finance and is governed by its own Act of incorporation. (See footnote, p. 134.)

The Canada Council.—Established by Order in Council dated Apr. 15, 1957, this corporation of 21 members, a Director and an Associate Director operates under the terms of the Canada Council Act, assented to Mar. 28, 1957. Its functions are the encouragement of the arts, humanities and social sciences in Canada. Its work is financed from the earnings of a \$50,000,000 Endowment Fund and a \$50,000,000 University Capital Grants Fund. In the making, managing and disposing of investments under the Act, the Council has the advice of an Investment Committee of five, including the Chairman and another member of the Council. The proceedings of the Council are reported each year to Parliament through the Prime Minister.

Canadian Arsenals Limited.—This company was established under the Companies Act by Letters Patent dated Sept. 20, 1945, and is subject to the Government Companies Operation Act (RSC 1952, c. 133) and certain provisions of the Financial Administration Act (RSC 1952, c. 116). The company was set up to take over and operate Crown-owned plant and equipment.

Among the items it now manufactures are propellants and explosives, small arms, radar equipment, optical and electronic instruments, and a wide variety of ammunition and components. Its divisions, together with the location of their plants, are as follows: Dominion Arsenal Division (Quebec and Val Rose, Que.); Explosives Division (Valleyfield, Que.); Filling Division (St. Paul l'Ermite, Que.); Gun Ammunition Division (Lindsay, Ont.); Small Arms Division (Long Branch, Ont.); Instrument and Radar Division (Scarborough, Ont.). The company is responsible to Parliament through the Minister of Defence Production.

Canadian Broadcasting Corporation.—The Broadcasting Act, 1958 provides that the Canadian Broadcasting Corporation shall conduct a national broadcasting service. To fulfil this function the Corporation shall have a Board of Directors consisting of a President, a Vice President and nine other Directors appointed by the Governor in Council. The President and Vice President are full-time executives appointed for a period of seven years; the other nine Directors are appointed to hold office for periods of three years and may serve two consecutive terms.

The President is the Chief Executive of the Corporation and, with the Vice President, is responsible to the Board of Directors for the conduct of the affairs of the Corporation. Located at the Head Office are the senior officers reporting to the President and Vice President who either direct staff departments or the three operating divisions of the corporation. The Staff Departments, headed by Vice Presidents, are: Programs; Administration and Finance; Corporate Affairs; and Engineering and Operations. The Operating Divisions, headed by General Managers who participate in corporate management activities, are: Regional Network Broadcasting; French Network Broadcasting; and English Network Broadcasting. The Corporation reports to Parliament through a Minister of the Crown (at present the Minister of National Revenue).

Canadian Commercial Corporation.—This Corporation was established on May 1, 1946 by the Canadian Commercial Corporation Act (RSC 1952, c. 35). It purchases goods and commodities in Canada for the governments of other countries. It also acts as purchasing agent for international agencies such as the United Nations International Children's Emergency Fund and the United Nations Korean Reconstruction Agency. Other functions include arranging production and shipment of Canadian contributions of military stores to NATO countries. The Corporation also serves other departments of the Government of Canada. For instance it arranges for the purchase and production of supplies and services which the Department of Trade and Commerce is making available to other countries under the Colombo Plan. In carrying out its functions the Corporation works closely with the Department of Defence Production. It is responsible to Parliament through the Minister of Defence Production.

Canadian Maritime Commission.—The Commission was created in 1947 (RSC 1952, c. 38) to consider and recommend policies and measures necessary for the operation, maintenance, manning and development of a merchant marine and a ship-building and ship-repairing industry. The Commission is established as a separate Department of the Government of Canada though it reports to Parliament through the Minister of Transport.

Canadian National Railways.—The Canadian National Railway Company was incorporated (SC 1919, c. 13) to operate and manage a national system of railways, including the Canadian Northern Railway System, the Canadian Government Railways and all lines entrusted to it by Order in Council. In 1923 the Grand Trunk Railway Company of Canada was amalgamated with the Canadian National Railway Company and since 1923 a number of railway lines acquired by the Government have been entrusted to the Company for operation and management, including the Newfoundland Railway and steamship services in 1949 and the Temiscouata Railway in 1950. The Canadian National Railways Act, 1919 was repealed in 1955 and the Canadian National Railways Act (SC 1955, c. 29) substituted therefor.

The Canadian National Railway Company is controlled by a Chairman and Board of Directors appointed by the Governor in Council, who report to Parliament through the Minister of Transport.

Canadian Overseas Telecommunication Corporation.—This Crown company was created on Dec. 10, 1949 by Act of Parliament (RSC 1952, c. 42) to acquire for public operation external telecommunication assets in Canada, in keeping with the Commonwealth Telegraph Agreement signed May 11, 1948. This Agreement was designed to bring about the consolidation and strengthening of the radio and cable communication systems of the Commonwealth. The Corporation is responsible to Parliament through the Minister of Transport.

Canadian Patents and Development Limited.—Canadian Patents and Development Limited is a Crown corporation established in 1948, pursuant to authority granted in an amendment to the Research Council Act which was passed in 1946. The primary purpose of the company is to make available to industry, through licensing arrangements, new processes developed by scientific workers of the National Research Council. Its services are equally available to other Government Departments, publicly supported institutions and universities. The company also has cross-agency arrangements with similar government agencies in other Commonwealth countries. The Board of Directors is composed of representatives from the National Research Council, from Government departments and from industry and the universities. Any profits that the company

may derive from licensing arrangements are available for further research and development. The Corporation reports to Parliament through the Chairman of the Committee of the Privy Council on Scientific and Industrial Research (at present the Minister of Trade and Commerce).

Canadian Wheat Board.—The Board was incorporated in 1935 under the Canadian Wheat Board Act to market, in an orderly manner, in the interprovincial and export trade, grain grown in Canada. Its powers include authority to buy, take delivery of, store, transfer, sell, ship or otherwise dispose of grain. Except as directed by the Governor in Council, the Board was not originally authorized to buy grain other than wheat but, since Aug. 1, 1949, it may also buy oats and barley. Only grain produced in the designated area, which includes Manitoba, Saskatchewan, Alberta and parts of British Columbia and Ontario, is purchased by the Board, which controls the delivery of grain into elevators and railway cars in that area as well as the interprovincial movement and export of wheat, oats and barley generally. The Board is governed by its own Act of incorporation (see footnote, p. 134). It reports to Parliament through the Minister of Trade and Commerce.

Central Mortgage and Housing Corporation.—This Corporation was incorporated by Act of Parliament (RSC 1952, c. 46) in December 1945 to administer the National Housing Acts. Under the National Housing Act, 1954 (SC 1953-54, c. 23, as amended 1956, c. 9, and 1957-58, c. 18), the Corporation insures mortgage loans made by approved lenders for home ownership and rental housing, makes direct loans, provides home improvement and rental guarantees, undertakes jointly with provincial governments the assembly of land and the construction of housing projects, conducts housing research, encourages community planning and owns and manages rental housing units built for war workers and veterans. The Corporation also arranges for and supervises the construction of housing projects on behalf of the Department of National Defence and other Government departments and agencies. The Corporation is responsible to Parliament through the Minister of Public Works.

Crown Assets Disposal Corporation.—This Corporation is established under the Surplus Crown Assets Act (RSC 1952, c. 260) and is subject to the Financial Administration Act (RSC 1952, c. 116). In June 1944, War Assets Corporation was established by statute to replace War Assets Corporation Limited which had been incorporated in 1943. In 1949 the name of War Assets Corporation was changed to Crown Assets Disposal Corporation. The Corporation's function is to dispose of surplus Crown assets. It is responsible to Parliament through the Minister of Defence Production.

Defence Construction (1951) Limited.—This company was established by Letters Patent in 1951 to take over the general undertakings of Defence Construction Limited. The company carries out all defence construction with the exception of houses and airfield runways and is responsible to Parliament through the Minister of Defence Production.

Director of Soldier Settlement and Director of the Veterans' Land Act.—The Director of Soldier Settlement (under the Act of 1919) is also the Director of the Veterans' Land Act, and in each capacity is legally a corporation sole. For administrative purposes, however, the programs carried on under both Acts constitute integral parts of the services provided by the Department of Veterans Affairs.

Dominion Coal Board.—The Board, established as a department in 1947 by the Dominion Coal Board Act (RSC 1952, c. 86), has the responsibility of studying and recommending to the Government policies concerning the production, import, distribution and use of coal. The chairman has the status of a deputy minister and the Board reports to Parliament through the Minister of Mines and Technical Surveys. The Board administers transportation and other subventions relating to coal, including those under the Atlantic Provinces Power Development Act (SC 1957-58, c. 25). It also administers loans authorized under the Maritime Coal Production Assistance Act (RSC 1952, c. 173). The Dominion Coal Board Act makes provision for the regulation and control of the production, distribution and use of fuel in times of national emergency.

Eastern Rockies Forest Conservation Board.—The Board was appointed in 1947 under the Eastern Rocky Mountain Forest Conservation Act which authorized an agreement between the Government of Canada and the Province of Alberta relating to the protection and conservation of the forests of that area of the eastern slope of the Rocky Mountains which forms part of the watershed of the Saskatchewan River. The function of the Board is to plan, supervise and undertake construction, operation and maintenance of projects and facilities necessary for the proper protection of the forests of the area to obtain the greatest possible flow of water in the Saskatchewan River and its tributaries.

During the first seven years of the agreement, the Federal Government undertook to provide \$6,300,000 for capital expenditure and Alberta to provide funds for maintenance expenditure. During the period of capital expenditure the Federal Government agreed to appoint the chairman and one member and the province one member. After the capital period the arrangement was that the Federal Government appoint one member and that the Government of Alberta appoint two members and name one of the three as chairman. This latter arrangement became effective on Apr. 1, 1955 and the Province of Alberta is now responsible for all future capital and maintenance

costs of this area. Under a further amendment made in 1957, an undertaking by the Federal Government to share in certain forest fire fighting costs was deleted, and upon termination of the agreement all property acquired by the Board is to belong to the province. The Board reports to Parliament through the Minister of Northern Affairs and National Resources. (See footnote, p. 134.)

Eldorado Aviation Limited.—This company was incorporated Apr. 23, 1953 to carry air traffic, both passenger and freight, for Eldorado Mining and Refining Limited and its wholly owned subsidiary, Northern Transportation Company Limited. It reports to Parliament through the Chairman of the Committee of the Privy Council on Scientific and Industrial Research (at present the Minister of Trade and Commerce).

Eldorado Mining and Refining Limited.—Set up in 1944 under the name of Eldorado Mining and Refining (1944) Limited (the date was omitted from the name in June 1952), the company's business is that of mining and refining uranium ores in Canada. The company has also entered into contracts for the purchase of uranium concentrates from private producers in Canada. It reports to Parliament through the Chairman of the Committee of the Privy Council on Scientific and Industrial Research (at present the Minister of Trade and Commerce).

Export Credits Insurance Corporation.—This Corporation commenced operations in 1945 under the Export Credits Insurance Act, 1944 (RSC 1952, c. 105) and is administered by a Board of Directors (including the Deputy Minister of Trade and Commerce and the Deputy Minister of Finance) with the advice of an Advisory Council. Its function is to insure Canadian exporters against non-payment by foreign buyers arising out of credit and political risks involved in foreign trade. The Corporation reports to Parliament through the Minister of Trade and Commerce.

Farm Credit Corporation.—This Corporation was established on Oct. 5, 1959 (SC 1959, c. 43) for the purpose of providing for the extension of long-term mortgage credit to farmers. The Corporation is responsible to Parliament through the Minister of Agriculture.

Fisheries Prices Support Board.—The Board was set up in July 1947 (RSC 1952, c. 120) to recommend to the Government price support measures when severe price declines occur. The Board functions under the direction of the Minister of Fisheries and consists of a chairman, who is a senior officer of the Department of Fisheries, and five members chosen from private and co-operative firms in the industry. The Board has authority to buy fishery products and to sell or otherwise dispose of them or to pay producers the difference between a price prescribed by the Board and the average price the product actually commands.

Industrial Development Bank.—The Bank, a subsidiary of the Bank of Canada, was incorporated in 1944 to provide loans to industrial enterprises where financing is not available through recognized lending organizations. (See footnote, p. 134.)

National Battlefields Commission.—This Commission was established by Act of Parliament in 1908 to preserve the historic battlefields at Quebec City. The Commission is composed of nine members, seven being appointed by the Federal Government and one each by the Provinces of Ontario and Quebec. The Commission is supported by an annual statutory grant from the Federal Government and is responsible to Parliament through the Minister of Northern Affairs and National Resources.

National Capital Commission.—This Commission is a Crown agency created by the National Capital Act (SC 1958, c. 37), proclaimed Feb. 6, 1959. It is the lineal descendant of the Federal District Commission.

The Commission is served by a full-time paid chairman and comprises a total of twenty members representative of the ten provinces of Canada. There is a staff of officials numbering seven reporting to a general manager, and a permanent work force of about 550.

Co-ordination and development of public lands in the National Capital Region are undertaken by direct planning and construction by the Commission's staff; by co-operation with municipalities; by provision of planning aid or financial assistance in municipal projects; and by advising the Department of Public Works on the siting and appearance of all Federal Government buildings in the 1,800-sq. mile National Capital Region. The Commission reports through the Minister of Public Works.

National Gallery of Canada.—The National Gallery of Canada was founded in 1880. By Act of Parliament in 1913, re-enacted in 1951, it was placed under the management of a Board of Trustees appointed by the Governor General in Council and now operates under the National Gallery Act (RSC 1952, c. 186). It is responsible to Parliament through a Minister of the Crown (at present the Minister of Citizenship and Immigration).

The first charge of the National Gallery is the development and care of the national art collections. Other important services are the arrangement of loans and exhibitions from abroad and from its own holdings for showing in Canada and abroad, the promotion of good industrial design and general extension work consisting of the distribution of reproductions for educational purposes, lectures, educational tours, publications, school broadcasts and art films.

National Harbours Board.—The Board was established by Act of Parliament in 1936. It is responsible for the administration of port facilities at Halifax, Saint John, Chicoutimi, Quebec, Trois Rivières, Montreal, Vancouver and Churchill, the Jacques Cartier and Champlain bridges at Montreal Harbour, and the government grain elevators at Prescott and Port Colborne, Ont. The Board is responsible to Parliament through the Minister of Transport.

National Research Council.—In 1917 the Research Council Act was passed and in 1928 laboratories for scientific research were established at Ottawa. The National Research Council now has Divisions of Pure and Applied Chemistry, Building Research, Mechanical Engineering, the National Aeronautical Establishment, Radio and Electrical Engineering, Pure and Applied Physics, Applied Biology and Medical Research. Regional laboratories have been established at Saskatoon, Sask., and Halifax, N.S.

Patentable processes and improvements developed by the Council are made available under licence to industry through a Crown company, Canadian Patents and Development Limited, and any profits from the licensing arrangements are used for further research and development.

The National Research Council reports to Parliament through the Chairman of the Committee of the Privy Council on Scientific and Industrial Research (at present the Minister of Trade and Commerce).

Northern Canada Power Commission.—The Commission was established by Act of Parliament in 1948 to bring electric power to points in the Northwest Territories where a need developed and where power could be provided on a self-sustaining basis. The Act was amended in 1950 to give authority to the Commission to provide similar services in Yukon Territory; the name of the Commission, formerly Northwest Territories Power Commission, was changed in 1956. The Commission is composed of a chairman and two members appointed by the Governor in Council. It operates hydro-electric plants on the Snare River in the Northwest Territories and on the Yukon River (near Whitehorse) and the Mayo River in Yukon Territory. An additional hydro plant is under construction on the Snare River 10 miles downstream from the Snare Rapids plant. The Commission operates diesel-electric plants at Fort Smith, Fort Simpson, Yellowknife and Inuvik, N.W.T., and at Field, B.C.; a small diesel plant for the school and hostel at Fort McPherson, N.W.T., and a Department of Transport diesel-electric plant at Frobisher Bay, N.W.T.

The Minister of Northern Affairs and National Resources reports to Parliament for the Commission.

Northern Transportation Company Limited.—This Company was incorporated in 1947 under the title of Northern Transportation Company (1947) Limited, the date being omitted from the name in 1952. Previously a company chartered under an Alberta statute, it has been a wholly owned subsidiary of Eldorado Mining and Refining Limited since that Crown company was established and carries out the business of a common carrier in the Mackenzie River watershed. The Company is responsible to Parliament through the Chairman of the Committee of the Privy Council on Scientific and Industrial Research (at present the Minister of Trade and Commerce).

Northern Ontario Pipe Line Crown Corporation.—This Corporation was established by the Northern Ontario Pipe Line Crown Corporation Act (SC 1956, c. 10) for the purpose of constructing the northern Ontario section of the all-Canadian natural gas pipeline and of leasing, with an option to purchase, this section to Trans-Canada Pipe Lines Limited. In addition, the Corporation was authorized to make short-term loans to Trans-Canada Pipe Lines Limited for the construction of the western section of the pipeline. The Corporation is responsible to Parliament through the Minister of Trade and Commerce.

Pipeline installation on the northern Ontario section, which extends from the Manitoba-Ontario border to the vicinity of Kapuskasing, Ont., was completed on Oct. 22, 1958.

Park Steamship Company Limited.—After World War II this Company acted as an agent for Crown Assets Disposal Corporation in the sale and delivery to purchasers of Government war-built ships. This work is completed but the Company remains available to carry out any appropriate duties. It has no staff of its own, any necessary work being done by the staff of the Canadian Maritime Commission (see p. 137). The Company reports to Parliament through the Minister of Transport.

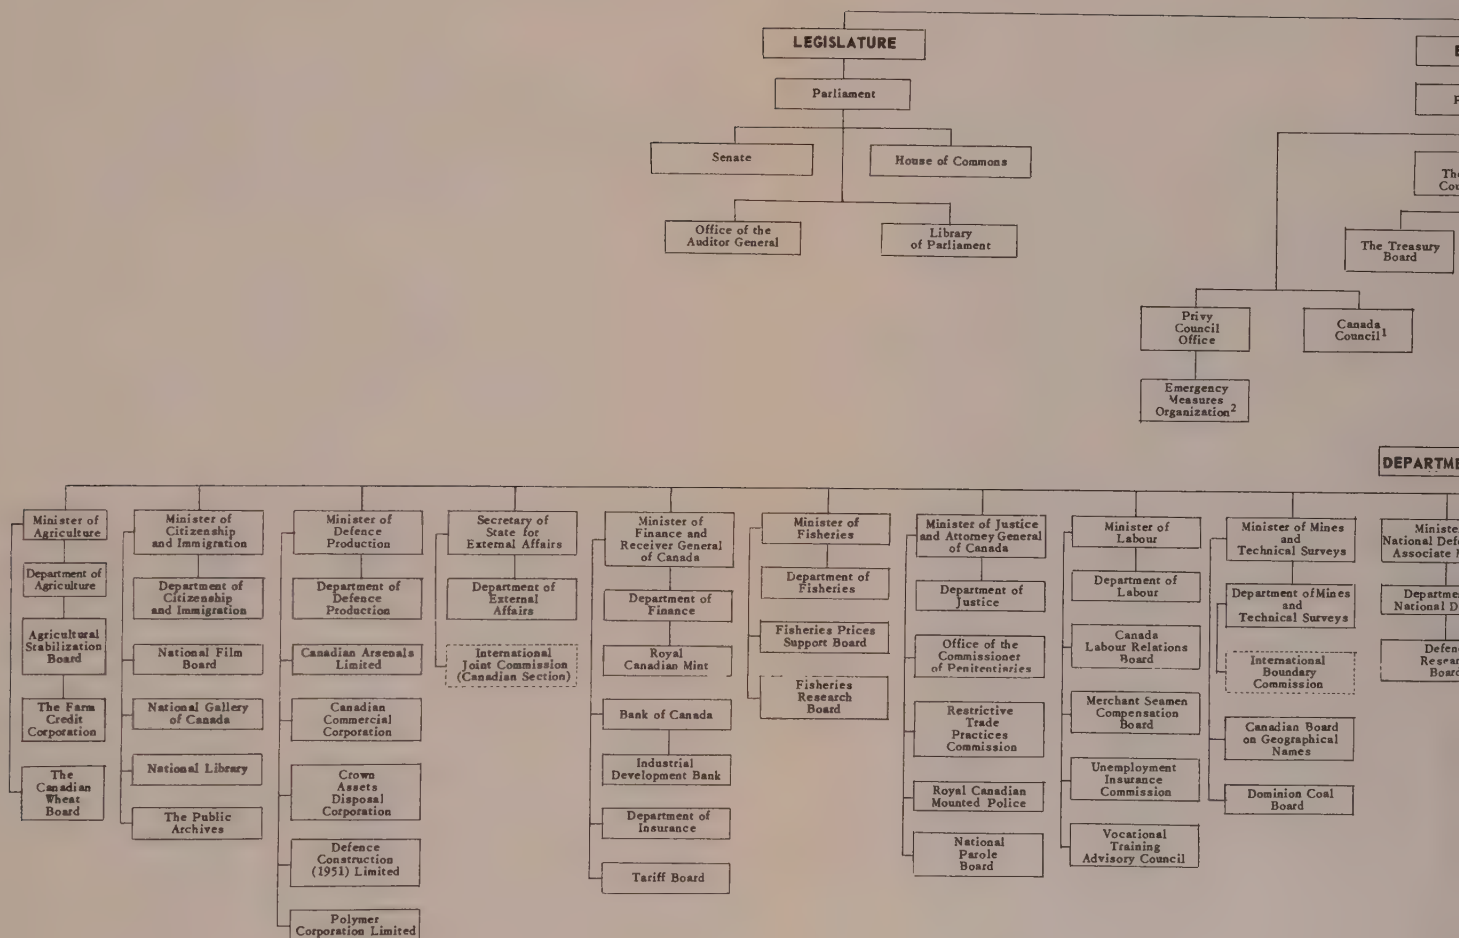

Polymer Corporation Limited.—This Corporation was established in 1942 by Letters Patent under the Companies Act and is subject to the Government Companies Operation Act (RSC 1952, c. 133) and the Financial Administration Act (RSC 1952, c. 116). It was set up to construct and operate a synthetic rubber plant which now produces a variety of synthetic rubber products and some chemicals. The plant is located at Sarnia, Ont. The Corporation is responsible to Parliament through the Minister of Defence Production.

St. Lawrence Seaway Authority.—The St. Lawrence Seaway Authority was established by Act of Parliament in 1951 (RSC 1952, c. 242) and came into force by proclamation on July 1, 1954. The Authority is incorporated for the purposes of constructing, maintaining and operating all such works as may be necessary to provide and maintain, either wholly in Canada or in conjunction with works undertaken by an appropriate authority in the United States, a deep waterway between the Port of Montreal and Lake Erie. The Authority is composed of a President, a Vice-President and a Member and reports to Parliament through the Minister of Transport.

1. Not an Agent of the Crown but reports to Parliament through the Prime Minister.
2. Responsible, through the Secretary to the Cabinet, to the Prime Minister for the co-ordination of civil emergency planning, including civil defence. On September 1, 1959, the Departments of National Defence, Health and Welfare and Justice became responsible for specific civil defence functions; the Emergency Measures Organization for the residue.

Trans-Canada Air Lines.—TCA came into being by Act of Parliament in 1937 (RSC 1952, c. 268) to provide for the development of a publicly owned scheduled transcontinental air service. Transatlantic air services were inaugurated by TCA on behalf of the Canadian Government during World War II and scheduled operations were commenced at the end of the war. TCA now maintains passenger, mail and commodity traffic services over nationwide routes and also services to the United States, England, Scotland, Ireland, France, Belgium, Switzerland, West Germany, Austria, Bermuda, the Bahamas, Jamaica, Antigua, Barbados and Trinidad. TCA is responsible to Parliament through the Minister of Transport.

Unemployment Insurance Commission.—The Commission was appointed on Sept. 24, 1940 under the provisions of the Unemployment Insurance Act, 1940 (RSC 1952, c. 273) for the purpose of administering the Act and providing a National Employment Service. It is composed of three Commissioners appointed by the Governor in Council, of whom one is designated Chief Commissioner. One Commissioner, other than the Chief Commissioner, is appointed after consultation with organizations representative of workers and the other after consultation with organizations representative of employers. The Chief Commissioner is appointed to hold office for a period of ten years and each of the other Commissioners to hold office for a period not exceeding ten years. The Commission is responsible to Parliament through the Minister of Labour.

Section 3.—Acts Administered by Federal Departments*

List of the Principal Acts of Parliament Administered by Departments of the Government of Canada

NOTE.—Copies of individual Acts of Parliament and amendments may be obtained from the Queen's Printer, Ottawa, at prices of from 10 cents to \$1.50 per copy according to number of pages. Where duplications of certain Acts appear in the list, parts of these Acts are administered under the Departments given.

Department, Year and Chapter of Statute	Name of Act	Department, Year and Chapter of Statute	Name of Act

PART IV.—FEDERAL GOVERNMENT EMPLOYMENT

The Civil Service Commission.—The Federal Civil Service comprises, in the widest sense, all servants of the Crown—other than those holding political or judicial office—who are employed in a civil capacity and whose remuneration is paid wholly and directly from moneys voted by Parliament. Collectively they form the staffs of the various departments, commissions, boards, bureaus and other agencies of the Federal Government. Nearly every category of occupation is represented in the Civil Service. A few civil servants are appointed by one or both Houses of Parliament directly and a considerable number are appointed by departments and other agencies in accordance with the provisions of certain statutes, generally with executive approval of the Governor in Council. The remainder, by far the majority, are selected and appointed by the Civil Service Commission of Canada.

The Civil Service Commission as the central personnel agency of the Federal Government is the custodian of the merit principle in respect of both initial appointments and promotions. The steps by which the Commission came to be established in its present form constitute the record of Civil Service reform in Canada which began a year after Confederation and culminated in the passing of the Civil Service Act of 1918.

Recruitment.—The recruitment of civil servants is conducted by means of open competitive examination through which every citizen has the right to compete for positions in the service of his country. Examinations are held periodically as the staff requirements of the public service dictate. Any Canadian citizen may apply for headquarters positions open at Ottawa but applicants for local positions must normally be residents of the locality in which the vacancy occurs. Competitive examinations are announced through the press and through posters displayed on the public notice boards of post offices, offices of the National Employment Service, offices of the Civil Service Commission, and elsewhere. The examinations may be written, oral, a demonstration of skill, or any combination of these.

The names of persons successful in Civil Service examinations, arranged in order of rank, are recorded on eligible lists. Examination results are formally announced by publication in the *Canada Gazette* and each candidate—successful or unsuccessful—is advised of his standing. Appointments are made as required from the eligible lists which usually remain valid for one year.

The rank of the various successful candidates on eligible lists is influenced by the 'veterans' preference'. Actually the preference is limited largely, in accordance with its definition by law, to members of the Armed Forces who have served overseas in World War I or II or in the Korean theatre of operations. The highest order of preference is the 'disability preference' accorded to pensioners of the Armed Forces who as a result of their war service have been unable to resume their prewar civilian occupations.

In recent years the Civil Service Commission has decentralized its operations and now has ten district offices and six sub-offices across the country. The Commission is granting an increasing measure of autonomy and responsibility to these offices to permit more efficient service to field agencies.

Staff Training.—In 1947 the Commission set up a Staff Training Division to promote and guide a systematic service-wide training scheme. The training scheme, sponsored by the Commission, is a joint venture undertaken in co-operation with Federal Government departments, most of which have parallel training divisions. The Commission's Training Division is primarily a co-ordinating agency. It promotes and organizes activities, trains departmental instructors in the presentation of courses, prepares and on occasion gives

courses of general application to all departments, publishes booklets and other training aids, assists departments in developing training to meet specialized needs, and acts as a general clearing-house for the exchange of information on training matters.

Promotion.—It is a prime objective of the Civil Service Act to create a career service. The result is that promotion, like entrance to the Service, is based on merit and a sound promotion system in operation. The present procedure involves the consideration of three factors: efficiency of candidates in their present positions, fitness for the vacant positions, and seniority or length of service. Appeal machinery under Commission jurisdiction has been set up for those employees who feel that their qualifications have not been properly assessed.

Position Classification and Compensation.—Provision is made in the Civil Service Act for the classifying of positions in the public service. A system of position classification was instituted in 1919 and positions with like duties and responsibilities were classified alike and remunerated equally. Each position has a title, a set of tasks or duties which are proper to it in the organization in which it occurs and, arising out of these duties, a set of qualifications appropriate for their performance. Positions with duties of similar kind are grouped together under a common title to form a class, and grades within the class reflect the level of responsibility.

The determination of rates of compensation for each class is a continuing responsibility of the Commission and salary and wage surveys are conducted constantly through its Pay Research Bureau, which compiles objective and current information concerning levels of pay within and without the Public Service for the use not only of the Commission but also of the Government and the employees concerned. Position classification is a main-spring in the Commission's primary function of recruitment, involving the fixing of standards of qualification for each class of position.

Organization and Methods.—In recent years there has been an increasing awareness of the extent to which economical administration depends on the adoption of modern management techniques and devices. In 1948 the Commission set up an Organization and Methods Service to study problems of management in collaboration with officials directly responsible for major areas of administration. This Service affords practical assistance to departments and other agencies of the Government through the systematic examination of structure, operations, procedures and work methods. Its growing facilities are offered free of charge to all departments.

Statistics of Federal Government Employment.*—The current monthly survey of Federal Government employment, started in 1952, is intended to cover all employees of the Government of Canada; employees in this sense exclude the Governor General and Lieutenant-Governors, Ministers of the Crown and Members of Parliament, judges, persons under contract and members of the Armed Forces, but include Force members of the Royal Canadian Mounted Police. This survey is much more inclusive than the previous statistical series entitled "Civil Service of Canada" and comparisons between the two sets of figures should be made only after very careful study.

The survey is divided into two main portions: (1) departmental branches, services and corporations, and (2) agency and proprietary corporations and other agencies.

Departmental Branches, Services and Corporations.—Employees in this group are covered in Tables 1 to 4; their salaries are paid from the Consolidated Revenue Fund. Definitions of classifications are as follows. "Salaried" employees include all persons paid

* Prepared in the Public Finance and Transportation Division, Dominion Bureau of Statistics.

on the basis of an annual salary rate with the exception of ships' officers who, though paid an annual salary rate, are subject to special treatment under the regulations made pertaining to the Financial Administration Act. The salaried staff are employed in departmental branches, services and corporations which are subject to regulation by the Treasury Board and for which the positions are outlined in detail in the Estimates of Canada, or are established by means of supplementary Treasury Board Minutes. Thus this group of employees includes persons who are subject to the provisions of the Civil Service Act plus salaried persons employed on the staffs of Cabinet Ministers and appointed by statute or by Order in Council, and also the salaried staffs of certain administrative branches of the Government that do not fall under the jurisdiction of the Civil Service Act.

"Prevailing Rate" employees are those who occupy continuing positions that are subject to prevailing rate legislation and are therefore paid on the basis of the going salary for similar work in the area in which the individual is employed. Regulations made under authority of the Financial Administration Act govern the third group entitled "Ships' Officers and Crews".

These three groups comprise what may be called the "regular" employees of the government service. "Casuals and Others" are persons employed on a non-continuing basis.

1.—Employees in Departmental Branches, Services and Corporations of the Federal Government, at End of Each Month, Years Ended Mar. 31, 1958 and 1959

NOTE.—Includes departments, boards, commissions, etc., listed in Tables 3 and 4 but excludes agency and proprietary corporations and other agencies, figures for which are given in Table 5.

¹ Includes Christmas overtime pay of Post Office employees.

Table 3 presents statistics for departmental branches, services and corporations on the basis of a classification by function. The purpose of such classification is to supply a means of studying the operation of government without the complication that results from differences in administrative establishment. This analysis is useful in three ways. First, it permits a detailed study of employment by the Government of Canada according to the main purposes or functions and, since these functions are not subject to the periodic changes that alter the administrative structure of the government, it is possible to develop a statistical series which, with minor exceptions, is consistent over an extended period of time. Secondly, since differences in administrative establishment are eliminated, it is possible to make meaningful comparisons between Federal Government expenditures on employment and similar expenditures by other levels of government. Thirdly, an analysis of the relationship between expenditures on employment and total expenditures may be made with regard to each function.

Table 4 is an administrative analysis of departmental branches, services and corporations, showing staff strength of these bodies as they are organized at present. Comparisons over a period of years should be based on the classification by function given in Table 3. In using these figures it should be noted that March employment of prevailing rate staffs is generally at a fairly low level as compared with summer months. Also, although most salaried staffs fluctuate little during the year, the Taxation Branch of the Department of National Revenue reaches peak employment in March and April because of the heavy flow of income tax returns during that period, the Legislation group employs extra staff during each session of Parliament, and certain departments employ considerable numbers of students in the summer months.

3.—Federal Government Employees as at Mar. 31, 1959, and Regular Earnings for the Year Ended Mar. 31, 1959, classified by Function

NOTE.—Excludes agency and proprietary corporations and other agencies, figures for which are given in summary form in Table 5.

Section 2.—International Activities, 1958-59

Subsection 1.—Canada and Commonwealth Relations

Throughout the period from mid-1958 to mid-1959 the vigour and significance of the Commonwealth continued to be demonstrated in a variety of ways. In addition to the constant process of Commonwealth consultation, the importance of which is by no means diminished by the fact that it usually attracts little public attention, there were several important formal Commonwealth meetings and a number of exchanges of visits by leading Commonwealth officials.

Canada was privileged in the early summer of 1959 to welcome Her Majesty Queen Elizabeth II who, in addition to being Queen of Canada, occupies the unique position of Head of the Commonwealth. Her Majesty, accompanied by His Royal Highness the Prince Philip, came to Canada to officiate at the opening of the St. Lawrence Seaway and made an extensive tour of the country. Her Royal Highness the Princess Margaret spent a month in Canada in the summer of 1958.

Perhaps the most important formal Commonwealth meeting during the period was the Commonwealth Trade and Economic Conference which was held at Montreal in September 1958 under the chairmanship of Canada's Minister of Finance. The central theme of the Conference, which was attended by representatives of all member countries and of a number of colonial territories, was "an expanding Commonwealth in an expanding world". Several important decisions, designed to increase trade within the Commonwealth, and between the Commonwealth and other countries, were announced at the Conference by Canada, the United Kingdom and others. Considerable attention was

also devoted to the problem of assisting the economic advancement of less-developed areas. In this connection information on Canada's part in the Colombo Plan and in Commonwealth technical assistance is given in Subsection 4, pp. 169-170.

The Conference recognized that the provision of extended educational and training facilities was an essential condition of the economic development of the Commonwealth. Agreement was reached in principle on the initiation of a new scheme of Commonwealth scholarships and fellowships, under which it is intended that in due course a thousand Commonwealth scholars and fellows should be studying in other Commonwealth countries at any one time. Of these, some 250 will be studying in Canada. This initiative was followed up at a Commonwealth Conference on Education held at Oxford in the summer of 1959.

The latest countries to reach full membership in the Commonwealth are Ghana and the Federation of Malaya—in March and August, respectively, of 1957. To both countries Canada has appointed High Commissioners, as well as to the West Indies Federation. Nigeria has progressed rapidly towards independence, an event scheduled for Oct. 1, 1960; with a population of some 35,000,000 it will be the largest single country in Africa. Nigerian leaders made it known that they hoped their country would remain associated with the Commonwealth after independence. The Secretary of State for External Affairs announced in July 1959 that Canada intended to open a diplomatic mission in Lagos, Nigeria, at an early date. He indicated at the same time that it is the Government's intention to open a diplomatic mission in Salisbury, the capital of the Federation of Rhodesia and Nyasaland, as soon as circumstances permit.

Perhaps the most extensive visit to other Commonwealth countries by a Commonwealth leader during this period was undertaken by Prime Minister Diefenbaker in the autumn of 1958. After a short stop at New York, the Prime Minister spent a week in the United Kingdom where he had useful talks with Prime Minister Macmillan. He made brief visits in France, Germany and Italy and to the Canadian Armed Forces in Europe. Official visits followed to Pakistan, India, Ceylon, the Federation of Malaya, Australia and New Zealand, with brief stops in Singapore and Indonesia. The Prime Minister, who was accompanied by Mrs. Diefenbaker, was welcomed in each Commonwealth country by its Prime Minister. In speeches and at press conferences he repeatedly expressed his belief in the vitality of the Commonwealth and in the importance of its role in the world.

Canada received a number of distinguished Commonwealth visitors: the Prime Minister of Ghana, Dr. Kwame Nkrumah; the Prime Minister and Minister of Foreign Affairs of New Zealand, Mr. Walter Nash; the Prime Minister of Australia, Mr. R. G. Menzies, and the Minister for External Affairs, Mr. R. G. Casey; the Governor General of the West Indies Federation, Lord Hailes, and the Prime Minister, Sir Grantley Adams; the Minister of Finance of Pakistan, the Chief Justice of Nigeria, and many others. Visitors from the United Kingdom included the Prime Minister, Mr. Harold Macmillan, the Foreign Secretary, Mr. Selwyn Lloyd, and the Secretary of State for Commonwealth Relations, Lord Home.

Subsection 2.—Canada and the United Nations

Apart from the appeal of Laos concerning alleged military aggression by North Viet Nam, the United Nations in 1959 had a respite from the recurrent international crises which had confronted the organization during the previous two years. The United Nations, however, continued its work of maintaining peace in sensitive areas, notably through the United Nations Emergency Force (UNEF). A new political issue, Communist China's repression in Tibet, came before the United Nations but the subjects receiving greatest attention at the fourteenth session of the General Assembly concerned disarmament and related problems.

The relative stability that seemed to prevail in the Middle East was partly a result of the intervention of the United Nations in late 1958. Through the Secretary-General, special United Nations representation, in addition to the United Nations Observation Group in Lebanon, was established in the area. The United States and the United Kingdom were able to withdraw their forces and the Observation Group began to disband late in the year.

Canada, in addition to participation in UNEF and UNTSO (United Nations Truce Supervision Organization) in the Middle East, played an active role in the several disarmament issues and took the initiative in a proposal for a greater measure of international co-operation through the United Nations Scientific Committee on the Effects of Atomic Radiation in the collection and collation of information on radiation and its effects. Concerning the United Nations-sponsored World Refugee Year, Canada took special action in accepting 100 tuberculous refugees and their families.

Developments in important United Nations bodies during the period under review are summarized below.

General Assembly.—The fourteenth session of the General Assembly met in New York from Sept. 15 to Dec. 13, 1959, under the presidency of Señor Victor Belaunde of Peru. The Hon. Howard Green, Secretary of State for External Affairs, was chairman of the Canadian Delegation.

A new item to come before the Assembly was the appeal of the Dalai Lama concerning Communist China's suppression of the revolt in Tibet. This appeal aroused considerable sympathy in the West and among Asian and African nations but a number of countries expressed doubt as to the usefulness of an Assembly debate on the issue. A formal draft resolution calling in particular for "respect for the fundamental human rights of the Tibetan people" was presented and adopted by a vote of 45 to 9, with 26 abstentions. Canada supported the resolution but in so doing followed the general line of emphasizing human rights and the rule of law.

Premier Khrushchov's Sept. 18 speech to the General Assembly in which he proposed "general and complete" disarmament, together with suggestions made by the United Kingdom Foreign Secretary, produced a major debate on disarmament. The Soviet delegation sought outright United Nations endorsement for the Khrushchov plan, which called for a four-year time-table that would eliminate all weapons of mass destruction, disband all armies, navies and military establishments, and leave to the individual States only "strictly limited contingents of police . . . to maintain order". Controls would be fully established only after the entire process was complete. The United Kingdom plan provided for a step-by-step approach toward total disarmament, beginning with a nuclear test ban and proceeding toward a cut-off of nuclear weapons production, the limitation and later reduction of armed forces, the destruction of all nuclear weapons and a final reduction in armed forces to internal security levels. Each step of the plan would be accompanied by appropriate international controls. In contrast to the Khrushchov plan, the United Kingdom envisaged an international police force under the United Nations to preserve world peace. The resolution adopted as a result of the debate on these proposals represented a compromise, and was sponsored by all 82 members of the United Nations. In particular, the resolution called on governments to make every effort to achieve a constructive solution of the disarmament problem and referred the proposals and related declarations to the ten-nation Disarmament Committee which had been agreed upon in September 1959 by the United States, the United Kingdom, France and the U.S.S.R. As an indication of the importance that Canada attaches to this Committee, it was announced toward the end of the year that Lieut.-Gen. E. L. M. Burns, after five years of distinguished service as Chief of Staff of UNTSO and UNEF Commander, was returning to Canadian Government service and would be the Canadian representative on the Disarmament Committee.

Canada has taken the position that the United Nations should be associated as closely as possible with the ten-nation Disarmament Committee. The United Nations Disarmament Commission convened on Sept. 10 to note with approval the creation of the Committee. It is intended that the Committee report regularly to the United Nations and that the United Nations, probably through the Disarmament Commission, discuss the progress of the Committee's work.

The General Assembly discussed a number of questions related to disarmament. The Canadian initiative for increased world-wide co-operation in the collection of data on radiation and a study of its effects was adopted unanimously. This proposal arose from Canada's recognition of the widespread concern over the possible hazards from radio-active fallout resulting from nuclear tests. It is hoped that expanded international co-operation through the United Nations Scientific Committee on the Effects of Atomic Radiation and the competent Specialized Agencies will stimulate research into the effects of low-level radiation on man and his environment and the distribution of fallout, and will enable soundly based judgments to be made as to the qualitative and quantitative nature of the hazards from nuclear testing. The Assembly also set up, by unanimous agreement, a special committee of 24 countries, including Canada, to consider further the problems of international co-operation in the peaceful uses of outer space. This committee replaces the previous one approved in 1958 but on which the U.S.S.R. had declined to participate because it considered the membership unsatisfactory.

The Assembly gave its attention to such continuing problems as Chinese representation, Hungary, Algeria, UNRWA, trusteeship questions, economic aid for under-developed countries and UNEF financing. The Assembly decided that at the fourteenth session there should be no discussion of the question of the representation of China. The discussion on Hungary coincided with reports of new repressive measures about which Canada expressed considerable concern. The Assembly "deplored" the failure of the U.S.S.R. and Hungary to honour previous United Nations resolutions which had called for the withdrawal of Soviet troops from Hungary and the admission of a United Nations representative to survey the situation there; it called on both nations to co-operate now. A resolution on Algeria which had general support from African and Asian members failed to get the required two-thirds majority. The Assembly extended for three years the life of the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA) and re-affirmed the right of the refugees to repatriation in Israel. On UNEF financing, the Assembly adopted a new scale of assessments for the annual \$20,000,000 required, which cut the assessment on smaller countries and put more emphasis on voluntary contributions from wealthier countries.

Security Council.—The year 1959 was the second of Canada's latest two-year term on the Security Council. In that year the Council was considerably less occupied than in 1958, only one question, concerning Laos, being formally discussed. Elections in the General Assembly for the non-permanent members of the Council for the period 1960-61, however, constituted a major problem which was resolved only with considerable difficulty.

At the request of the Secretary-General, the Council, on Sept. 7, considered the appeal, which had been addressed directly to Mr. Hammarskjöld by the Laotian Government, for a United Nations emergency Force to halt alleged military aggression in Laos by North Viet Nam and to prevent it from spreading. To avoid being paralyzed by the veto, the Council then adopted—as a procedural matter not subject to the veto, and by a vote of ten to one—a resolution which established a sub-committee of the Security Council under Article 29 of the Charter to "conduct such enquiries as it may determine necessary and to report to the Security Council as soon as possible". Argentina, Italy, Japan and Tunisia were named as members of the sub-committee which left New York for Laos on Sept. 12 and returned on Oct. 21 to report on its fact-finding mission; alternate representatives remained in Laos. Although the findings of the committee were not completely conclusive, the Secretary-General felt it useful to go to Laos personally and subsequently

left a personal representative there. As a result, some measure of stability seemed to be obtained in the area and no further meeting of the Security Council was considered necessary.

Japan's seat on the Security Council, which was to be vacated at the end of 1959, was contested strongly by Poland and Turkey. The U.S.S.R. took the view that, although an Eastern European country had not consistently held a seat on the Council, it was understood by a "gentleman's agreement" of 1946 that one of the six non-permanent seats should go to an Eastern European member. Canada indicated sympathy for the Polish candidature. At the end of the session of the General Assembly, and after 52 ballots, a compromise was accepted by which the two candidates would divide the two-year term.

Economic and Social Council (ECOSOC).—In the period under review, the Economic and Social Council held its resumed twenty-sixth and its twenty-seventh and twenty-eighth sessions. In 1958, Canada completed its third three-year term of office on the Council; Dr. G. F. Davidson, Deputy Minister of Welfare in the Department of National Health and Welfare, was President of the Council for the year. During 1959, Canada was a member of five of the Council's eight functional commissions—Status of Women, Narcotic Drugs, International Commodity Trade, Statistical, and Population. Canada will continue in 1960 to serve on all of these except the Statistical Commission. Although not a member of the Economic and Social Council, Canada was represented at the twenty-seventh session by an official observer.

Ever since the United Nations was established, its ten Specialized Agencies have been the chief instruments through which member States have pooled their efforts in trying to achieve the goals of higher standards of living, full employment and conditions of economic and social progress. Canada is a member of all the United Nations Specialized Agencies, and has worked to encourage and develop their programs.* The opportunities for useful and desirable work by the Agencies are unlimited, but since the funds available to them are not, the Council has sought to obtain maximum effect by co-ordinating their activities and by encouraging the application of a system of priorities for their programs. Canada has taken an active part in this phase of the work of the Council and, particularly, has recommended that the Agencies stimulate and support national efforts rather than engage in direct operations.

The Convention of the Intergovernmental Maritime Consultative Organization (IMCO) stipulated that 21 nations, of which seven should each have a total tonnage of not less than 1,000,000 gross tons, must signify their acceptance before this new Specialized Agency could officially come into being. With the deposit of instruments of ratification by Japan and the United Arab Republic on Mar. 17, 1958, the Convention on IMCO came into force. Canada was the first country to ratify the Convention, having done so on Oct. 15, 1948. The purpose of IMCO is to promote co-operation among governments in international shipping problems. Among the international problems with which it has to deal are the safety of life at sea, the prevention of collisions at sea, and the prevention of the pollution of the sea by oil. A conference to amend the International Convention on Safety of Life at Sea, 1948, will be held in London under IMCO auspices in 1960.

In addition, there came into existence on July 29, 1957 the International Atomic Energy Agency (IAEA). This body, though not technically one of the Specialized Agencies, is, like them, an autonomous international organization under the aegis of the United Nations. The provisions of the Statute of the International Atomic Energy Agency concerning both designation and election to the Board of Governors specified several categories of membership, including the selection as designated members of "the five members most advanced on the technical aspects of atomic energy, including the production of source materials". Canada, France, the United Kingdom, the United States and the Soviet Union achieved membership on the Board in this category.

* Canada's activities in connection with three of these Specialized Agencies—United Nations Educational, Scientific and Cultural Organization, Food and Agriculture Organization and International Labour Organization—are dealt with elsewhere in this volume. See Index.

The Economic and Social Council, at its twenty-sixth session held in Geneva during the month of July 1958, discussed United Nations activities in the field of economic assistance to under-developed countries. It adopted a resolution recommending to the General Assembly the establishment of a Special Fund which would enlarge the scope of the existing United Nations programs of assistance to include special projects in certain basic fields, such as extensive surveys of water, mineral and potential power resources, and the creation of training institutes in public administration, statistics and technology, and of agricultural and industrial research and productivity centres. The General Assembly approved the Council's recommendations and the Special Fund came officially into being on Jan. 1, 1959. The Canadian Government contributed \$2,000,000 to the Fund in 1959 and will seek Parliamentary approval for a further \$2,000,000 contribution in 1960. Canada has been elected as a member of the Governing Council of the Special Fund, to hold office for three years from Jan. 1, 1960.

For many years the United Nations and its Specialized Agencies have conducted special programs of assistance to overcome certain acute problems and serious deficiencies that exist in various areas. Money for these programs is not available through the regular United Nations budget nor through the regular budgets of the Specialized Agencies (these regular budgets are raised by assessing all member States, the scale of assessment being based mainly on gross national product) but must be raised from voluntary contributions made by member states. At present the United Nations is sponsoring four special programs: the United Nations Expanded Programme of Technical Assistance (ETAP); the United Nations Children's Fund (UNICEF); the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA); and the program of the United Nations High Commissioner for Refugees (UNHCR, formerly UNREF). Canada's contributions in 1959 were: \$650,000 to UNICEF; \$500,000 to UNRWA (plus a special contribution of \$1,500,000 worth of wheat flour); \$290,000 to the programs of the UNHCR; and \$2,000,000 to ETAP. Canada intends, subject to Parliamentary approval, to make similar regular contributions in 1960.

In 1958 the United Nations designated the period June 1959 to July 1960 as World Refugee Year and urged members to make an extra effort to help solve this problem. As a special contribution to World Refugee Year, Canada announced that it would admit 100 tuberculous refugees, with their families, for treatment and rehabilitation in Canada. The cost of this program for the initial year is estimated to be \$750,000 with substantial expenditures expected in succeeding years before the families are completely rehabilitated.

Canada has also announced its intention to seek Parliamentary approval for a contribution in the amount of \$100,000 to the Malaria Eradication Special Account of the World Health Organization for 1960. This voluntary fund was established in 1956 when the World Health Organization launched a campaign for the world-wide eradication of malaria. It is used to provide technical advice and assistance to countries undertaking national programs of malaria eradication.

Canada made a voluntary contribution of \$50,000 to the operational fund of the International Atomic Energy Agency with provision for a further \$25,000 if justified by the response from other members. Canada was also the first nation to make a free gift of approximately three tons of natural uranium metal to the Agency, which sold it to Japan. In addition, Canada paid an annual assessment to the United Nations, to some of the Specialized Agencies and to the International Atomic Energy Agency totalling about \$3,441,000 in 1959. Canada's share of the normal administrative budget of the United Nations proper for 1959 was at the rate of 3.11 p.c., or \$1,666,896.

Trusteeship Council.—The Trusteeship Council supervises the administration of the agreements between the United Nations and the member States of the United Nations which have responsibility for trust territories. The Council held two regular sessions, the twenty-third in January–March 1959 and the twenty-fourth in June–August 1959. It also held two special sessions, one in October 1958 and the other in November 1959.

At the end of October 1959, the membership of the Council consisted of the seven States which administer trust territories (Australia, Belgium, France, Italy, New Zealand, United Kingdom and United States), and an equal number of non-administering States. Always included in the latter group are the two permanent members of the Security Council—the U.S.S.R. and China—which do not administer trust territories. The other five non-administering countries were Burma, Haiti, India, Paraguay and the United Arab Republic.

During its regular sessions the Council considered reports from the administering authorities for Tanganyika under United Kingdom administration, Ruanda-Urundi under Belgian administration, Somaliland under Italian administration, the Cameroons under United Kingdom administration, the Cameroons under French administration, Togoland under French administration, Western Samoa under New Zealand administration, New Guinea under Australian administration, and Nauru under combined Australian, New Zealand and United Kingdom administration. In addition to considering the political, economic, social and educational progress made in the territories, the Council discussed the attainment by the trust territories of the objective of self-government or independence. Special attention was paid to study and training facilities for the inhabitants of the territories, economic aid for Somaliland and the effects of the European Economic Community on the development of certain of the territories.

During the review period, United Nations travelling missions visited the trust territories in West Africa, the trust territory of Western Samoa, and the trust territories of Nauru, New Guinea and the Pacific Islands. The reports of these missions were also considered by the Council. The Council learned that in 1960 three trust territories would achieve their independence: the French Cameroons on Jan. 1, Togoland on Apr. 27, and Somaliland on July 1. Plebiscites under a United Nations Commissioner were agreed upon for the Northern Cameroons in November 1959, and for the Southern Cameroons in the spring of 1961, in order to ascertain the desires of the inhabitants of these territories with regard to their future status after Nigeria attains its independence in October 1960.

The Council's Committee on Petitions considered more than 12,000 communications from petitioners and the Council itself granted oral hearing to petitioners from various territories under its tutelage.

Canadian policy with regard to trust territories is based on the belief that careful and unprejudiced consideration should be given both to the aspirations and legitimate demands of the indigenous populations and to the responsibilities and legitimate rights of the administering authorities. In the Canadian view, it is the responsibility of the General Assembly to decide broad policy matters and of the Trusteeship Council to plan its work and decide on the most expeditious manner of fulfilling its detailed responsibilities under the international trusteeship system.

International Court of Justice.—To "adjust and settle international disputes in conformity with Justice and International Law" is one of the purposes of the United Nations and it was therefore essential to establish a judicial arm for the Organization. The Statute of the International Court of Justice is an integral part of the Charter of the United Nations. All members of the United Nations are *ipso facto* parties to the Statute of the Court. A State that is not a member of the United Nations may, nevertheless, become a party to the Statute of the Court on conditions to be determined in each case by the General Assembly upon the recommendation of the Security Council. Thus, at the end of 1959, the total number of parties to the Statute was 85; 82 were members of the United Nations and three (Liechtenstein, San Marino and Switzerland) were non-members. The Court is composed of 15 judges who are elected in individual capacities. His Honour Judge John E. Read of Canada served on the Court from his election to the Court in 1946 until his retirement in 1958. No judge of Canadian nationality is serving on the Court at the present time.

Subsection 3.—Canada and the North Atlantic Treaty Organization

Within less than two years of the end of World War II in 1945 and the establishment of the United Nations, hopes of a lasting peace gave place to growing anxiety. The United Nations Security Council, which had been given responsibility for maintaining world-wide security, was deliberately prevented by the U.S.S.R. representatives from fulfilling this function. The Soviet Union maintained its armed forces after the War at a level that ensured to itself a preponderance of military strength in Europe. The Soviet Government blocked attempts by the Western Powers to reach a peace settlement in Europe and communist parties were used as an instrument of Soviet policy to sabotage Western European efforts at economic recovery and political co-operation. Under these circumstances, the countries of the Atlantic community felt themselves in grave peril of Soviet aggression and communist subversion and therefore took special collective measures under the United Nations Charter to maintain peace.

The first step in this direction was taken in the spring of 1948 when Belgium, France, Luxembourg, the Netherlands and the United Kingdom signed the Brussels Treaty establishing Western Union. On Apr. 4, 1949, as a result of negotiations between these countries and Canada and the United States, the North Atlantic Treaty was signed at Washington, D.C. This Treaty was accepted by all major groups of opinion in Canada and was passed without a single dissenting vote in Parliament.

The original signatories of the Treaty were Belgium, Canada, Denmark, France, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, the United Kingdom and the United States. In September 1951 it was agreed that Greece and Turkey should be invited to accede to the Treaty and they were admitted in February 1952. In October 1954 a protocol to the North Atlantic Treaty inviting the Federal Republic of Germany to join NATO was approved together with related arrangements which provided for the establishment of a Western European Union (composed of the Brussels Powers, the Federal Republic of Germany, and Italy) and for the restoration of full sovereignty to the Federal Republic of Germany. These measures, designed to bring the Federal Republic of Germany into close and enduring association with the Atlantic Community of free nations, were adopted following the failure of the European Defence Community Treaty which was rejected by the French Assembly in August 1954. On May 6, 1955, the Federal Republic of Germany deposited in Washington its instrument of accession to the North Atlantic Treaty and thus joined NATO as its fifteenth member.

The terms of the Treaty and the organization of the Council and subordinate committees are dealt with in the 1954 Year Book at pp. 113-115. Developments up to mid-1958 are given in the 1955, 1956, 1957-58 and 1959 editions.

Developments during 1958-59.—The North Atlantic Council continued in permanent session at Paris under the chairmanship of the Secretary-General, Mr. Paul-Henri Spaak. In October 1958, Mr. Jules Léger, the former Under-Secretary of State for External Affairs, succeeded Mr. L. D. Wilgress as Permanent Representative of Canada to the North Atlantic Council.

During the period under review, five Ministerial meetings of the Council were held. In April 1958 a special meeting of Defence Ministers was convened in Paris to review the implementation of the important decisions taken in the defence field by the NATO Heads of Government at their meeting the previous December. In May, the Foreign Ministers of the NATO countries met in Copenhagen to discuss various political and economic problems of concern to the Alliance and, in particular, the important questions relating to a possible East-West Summit conference.

The annual meeting of the Foreign, Defence and Finance Ministers of the member countries was convened in Paris in December 1958. The serious situation created by the Soviet Union in announcing its intention of abrogating unilaterally the four-power agreements on Berlin was fully examined. Agreement was reached on the basis of the results of the Dec. 15 meeting of the Foreign Ministers of the United States, the United Kingdom,

France and the Federal Republic of Germany which found the Soviet proposal of Nov. 27 on Berlin unacceptable and reaffirmed the determination of the three Western occupying powers to maintain their position and rights in Berlin, including the right of access to the city. In addition, after hearing reports by NATO military commanders on the strength of NATO Forces and the continuing increase in Soviet armaments, the Ministers emphasized the vital need to improve the defensive power of the Alliance.

Two Ministerial meetings of the Council were convened during 1959. The regular spring meeting of Foreign Ministers was held in Washington on Apr. 2-4. A special ceremony at the opening session marked the tenth anniversary of the Treaty, which was signed in Washington on Apr. 4, 1949. The Council directed its attention to the central problem posed by the Soviet Union's pronouncements on Berlin and Germany. Discussion centred mainly on the Western position for the negotiations with the Soviet Union scheduled to commence at Geneva later in the spring, upon which there was general agreement. The Ministers expressed desire to see outstanding problems solved by negotiation and confirmed the principles contained in the Council's declaration on Berlin of Dec. 16, 1958.

The year's work of the Council culminated with the meeting of the Foreign, Defence and Finance Ministers held in Paris Dec. 15-17 and again on Dec. 22 following a meeting during the intervening period of the Heads of Government of the United States, the United Kingdom, France and the Federal Republic of Germany to consider preparations for an East-West Summit conference. In addition, the Foreign Ministers of the United States, the United Kingdom, France, Italy and Canada met on Dec. 21 to discuss arrangements for convening the Ten-Nation Disarmament Committee. The NATO Ministerial meeting was therefore concerned not only with its traditional review of the international situation and current NATO defence problems but with the more important matters relating to the forthcoming East-West Summit negotiations and preparation for negotiations with the Soviet Union on disarmament, both in the ten-nation Disarmament Committee and at the Summit. Agreement was reached on the arrangements for convening the Summit conference and the meetings of the Disarmament Committee, and for ensuring that there would be full consultation with NATO in preparing the Western position for these meetings.

In addition, the Permanent Council, together with its subordinate committees and its international staff, continued to devote its attention to international, political, economic and military developments of direct concern to the Alliance, reviewed the defence plans of its members, dealt with expenditures of funds on commonly financed military installations (infrastructure) and studied the measures required to ensure peacetime readiness and civil defence.

Canadian Contributions to NATO.—Canada continued in 1958-59 to provide contributions of Armed Forces to unified NATO commands, material assistance to other NATO countries and financial contributions to NATO common budgets. The Canadian contribution to the integrated forces in Europe comprised an Infantry Brigade Group stationed in Germany and an Air Division of twelve modern jet fighter squadrons at bases in France and Germany. During 1959 the Canadian Government decided to re-equip the eight day-fighter squadrons of the Air Division with a modern strike and reconnaissance aircraft, the CF-104. With the establishment of the North American Air Defence Command (NORAD) in 1958, Canada participated fully with the United States in the defence of the North American Continent, which harbours the main retaliatory forces of the Alliance and is an integral part of the NATO area. In addition, a substantial part of Canada's naval forces has been assigned to the Supreme Allied Commander Atlantic (SACLANT) for the protection of convoys and for the defence of the Canada-United States region, should an emergency arise.

Canada continued to provide assistance to NATO European countries in the form of military equipment, aircrew training, logistic support for material previously transferred, and contributions to NATO military and common infrastructure budgets. Approximately \$1,700,000,000 has been allocated for these purposes since 1950. After a peak of \$289,000,000 in 1953-54, the annual dollar value of the Canadian Mutual Aid Program declined to an estimated \$90,000,000 for the year ended Mar. 31, 1960. This decline was accounted for by the gradual depletion of Canadian surplus stocks of weapons and equipment, and by the successful completion in July 1958 of the full-scale NATO Air Training Plan carried out at RCAF establishments in Canada; under this training plan, started in 1950, over 5,500 pilots and navigators from ten member countries have been graduated. A limited number of aircrew from European countries are continuing their training in Canada under special agreements.

While changing conditions and requirements have gradually altered the magnitude and content of Canada's Mutual Aid Program, it continues to play an important role in the build-up of NATO military strength.

Subsection 4.—Canada and the Colombo Plan

The Colombo Plan for Co-operative Economic Development in South and South-east Asia was conceived at the Commonwealth Meeting of Foreign Ministers held at Colombo, Ceylon, Jan. 9-14, 1950. Although the Colombo Plan was initiated by Commonwealth Governments, it is not exclusively a Commonwealth program. It is designed to assist in the economic development of all countries and territories in the general area of south and southeast Asia. Its membership now includes Australia, British Borneo (North Borneo, Brunei and Sarawak), Burma, Cambodia, Canada, Ceylon, India, Indonesia, Japan, Laos, Malaya, Nepal, New Zealand, Pakistan, the Philippines, Singapore, Thailand, the United Kingdom and Viet Nam, as well as the United States which is also engaged in a substantial program of economic aid in the same region.

The Colombo Plan is essentially a bilateral program, but a Consultative Committee of Foreign Ministers of the member countries meets once a year to review projects, exchange views on policy matters and prepare an annual report. It is, as its name implies, a "consultative" body; no collective policy decisions binding member countries are taken by its meetings. To develop the technical assistance side of the Plan, a Council for Technical Co-operation, on which Canada is represented, meets regularly in Colombo.

From the beginning of the Plan in 1950 through April 1960, Canada will have made available a total of \$281,670,000 for capital and technical assistance projects in south and southeast Asia. At the Commonwealth Trade and Economic Conference held at Montreal in September 1958, Canada announced an increase from \$35,000,000 to \$50,000,000 in its annual contribution to the Colombo Plan over the following three years. In addition, Canada announced its intention to continue substantial financial assistance to less-developed countries in the form of loans and grants for Canadian wheat and flour.

While eleven separate countries have received capital assistance from Canada, the largest contributions so far have been made in India, Pakistan and Ceylon. The Canadian contribution has consisted primarily of direct assistance to various development projects (equipment for multi-purpose irrigation and hydro-electric projects, the Canada-India NRX atomic reactor, transportation equipment, fishing boats and surveys of resources). It has also included goods (wheat, flour, copper, aluminum and railway equipment) which the recipient governments have used as a means of raising some of the money needed to meet local costs of development programs. Canadian aid has been helping these countries to develop their economies and to raise their standards of living.

Under the Technical Assistance Programme, 1,308 persons from member countries had been received, up to Dec. 31, 1959, for training in Canada in a great variety of technical fields; 140 Canadian experts had been sent abroad for service in Colombo Plan countries in such fields as fisheries, refrigeration, marine biology, agriculture, soil erosion,

vocational training, accountancy and the maintenance of tractors and agricultural machinery. Other Canadian experts had been employed on aerial resources survey teams and in the installation and operation of capital equipment. Equipment for technical training in various fields had also been supplied.

The Consultative Committee of the Colombo Plan held annual meetings at Seattle, U.S.A., in 1958 and at Jogdjakarta, Indonesia in November 1959. At the Jogdjakarta meeting, Singapore was admitted to full membership in the Colombo Plan and it was agreed that the Plan should be extended to June 1966. Reports of the Committee on progress and future plans are published after each annual meeting; each report also contains sections describing the activities of member countries.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

This Chapter presents only a limited summary of the voluminous data on population recorded by the censuses of Canada. More detailed information and extended analyses are published in the Census volumes and bulletins, which are obtainable from the Queen's Printer or the Dominion Bureau of Statistics, Ottawa. A list of such publications and their prices is available on request.

Section 1.—Census of Population

Subsection 1.—History of the Census

A brief account of the early censuses of Canada is given under this heading in the 1956 Year Book at pp. 146-149. More detailed information on the history of census-taking in Canada may be found in Vol. XI (Administrative Report) of the 1951 Census of Canada, in the Administrative Report of the 1941 Census of Canada, and in Vol. I of the 1931 Census of Canada.

Plans for the 1961 Census.—On June 1, 1961, Canada's decennial nation-wide inventory—the Tenth Decennial Census since Confederation—will get under way. On that day, some 25,000 trained enumerators will start on their rounds of visitation. Planning for the huge task of obtaining accurate information on Canada's people, the homes they live in and the farms and businesses they operate, was started in July 1957 and since then the details of organization have been progressively settled. Decisions on the content of the census questionnaires have also required months of planning. Studies have been conducted on the costs and usefulness of various types of information requested for inclusion in the census; the views of users of census statistics have been secured by canvass to ensure that the inquiries will be limited to information of greatest demand and importance; field tests have been carried out to determine the feasibility of certain questions, the arrangement of the questionnaires, and the wording of inquiries; and studies have been made on the possibilities of employing sampling techniques in the collection of the census information.

* Revised in the Census (Demography) Division, Dominion Bureau of Statistics.

The over-all planning for the 1961 Census is being conducted in the Dominion Bureau of Statistics under the direction of the Census Executive Committee, with the Dominion Statistician as chairman. A number of working committees have been made responsible for the planning in particular fields such as field organization, publicity, training, population, housing, agriculture, tabulation, etc. They report their recommendations regularly to the Executive Committee.

Unlike the modified Census of 1956, taken mid-way between the Decennial Censuses to obtain very basic information on population and agriculture in a period of rapid population growth and far-reaching changes in the agricultural economy, the 1961 Census will parallel in scope the more detailed Censuses of 1951 and 1941. Coverage problems, however, will be considerably greater because the population will have increased by more than 4,000,000 since the 1951 Census, and by close to 7,000,000 since the 1941 Census.

Briefly, the Population Census of 1961 will inquire into the age, sex, marital status, birthplace, period of immigration, citizenship, origin, religion, language, mother tongue and schooling of each person. Economic characteristics will be obtained for persons 15 years of age or over, such as occupation, industry, class of worker and earnings of wage-earners. Males 25 years of age or over will be asked if they had any wartime service in the Armed Forces. Persons in every fifth (or sample) household will be asked their place of residence five years ago, and women in these sample households who have ever been married will be asked their date of marriage and the number of live-born children they have had during marriage. Persons in receipt of income other than wages or salaries in non-farm sample households will be asked the amount of such income during the 12 months preceding the census date.

The Housing Census for 1961 will be taken on a sample basis of every fifth household, as in 1951. Greater emphasis is being placed on obtaining data relating to the physical and structural characteristics of dwellings than in the preceding census. Inquiries will include types and conditions of dwellings; tenure and length of residence; numbers of rooms and bedrooms; water supply; bath, toilet and sewage facilities; home values, rents and mortgages; and such household facilities as heating equipment and fuel used, refrigerators, freezers, television sets and automobiles.

The Census of Agriculture will collect detailed information on the operation of Canada's farms and small agricultural holdings. Inquiries will be included on sizes of holdings, tenure, land use, crop acreages, numbers and kinds of livestock, and numbers and types of farm machinery and equipment. An important feature will be the classification of farms by economic class and type. A special questionnaire will be used to obtain information on wood products taken from farm woodlands, and one for reporting irrigation on farms in certain provinces.

The field enumerators gathering data on population, housing and agriculture will be utilized, as in the past three decennial censuses, to provide a list of all business firms coming within the scope of retail, wholesale and service establishments. Because of the complexity of business operations, information for the Census of Distribution will be obtained by means of questionnaires mailed from the Bureau to the firms listed by the census enumerators. They will include such questions as sizes and types of businesses, volumes of sales by commodity classes, stocks on hand, numbers of employees and amounts of payrolls.

Plans for the processing and tabulation of the 1961 Census results are being geared to the installation in the Dominion Bureau of Statistics building of an advanced type of electronic data-processing machine. This machine will perform most of the editing requirements (i.e., the searching of tape records of the census questionnaires for omissions and inconsistencies) as well as the operations required for the census tabulations. A high-speed printer operated in conjunction with the computer will print the tabulated results. Programming of the tabulations planned for the 1961 Census has been under way since the autumn of 1959 so that the full capacities of the computer may be utilized as soon as enumeration returns are received from the field offices.

Extensive use will be made of the Bureau's eight Regional Statistics Offices for the administration of the field work and for the initial checking and processing of the census returns. It was found in the 1951 and 1956 Censuses that decentralization of such early operations following the field enumeration resulted in important time and cost savings.

Results of the 1961 Census will begin to appear within a few months after the census date of June 1. The first to be issued will be preliminary population totals for all cities, towns, villages and rural municipalities. Final counts of population (after adjustments for temporary residents, persons missed by enumerators, etc.) will be issued for Canada and the provinces, counties, cities and towns, etc., early in 1962. These will be followed by basic distributions of the population such as age, sex, marital status and so on, and at about the same time the results of the Censuses of Agriculture and Housing will be becoming available. From then on, a great wealth of detailed statistical information on Canada's people, homes, farms and businesses as at mid-1961 will be on record for multitudes of users; another inventory of Canada's human and material resources will have been compiled to form a background of factual knowledge for the conduct of the nation's affairs.

Subsection 2.—Growth and Density of the Population

The population history of Canada, from the first census in 1666 when 3,215 persons were enumerated to the 1956 Census when the figure was 16,080,791, reveals an outstanding rate of population growth. Although each census period contributed to this growth, the periods 1901-11, 1911-21, 1941-51 and 1951-56 merit particular mention.*

In the first half of the present century, Canada's population increased from 5,371,315 at the beginning of the period to just over 14,000,000 in 1951, or to 13,648,013 if Newfoundland is excluded. In the thirty years up to 1931 the population almost doubled and between 1931 and 1951 another 3,600,000 was added. The most rapid growth took place in the first decade of the century when the population increased by 1,835,000 and the rate of growth was slightly over one-third. Coincident with the settlement of the western provinces, substantial immigration characterized the whole period from the beginning of the century up to the outbreak of World War I: immigrants entering Canada during the first ten years of this period numbered 1,644,147.

Owing partly to the sharp falling off in immigration during the war years and partly to heavier emigration, the rate of increase of Canada's population in the decade 1911-21 was less than in the previous decade; nevertheless total population advanced by 1,581,000 or about 22 p.c. It should be mentioned that, largely because of the record volume of immigration between 1911 and the outbreak of war, the actual number of immigrants to Canada during this decade was slightly greater than during the period 1901-11, although in terms of total population at the beginning of each of these periods immigration was a relatively less important factor in population growth in the decade 1911-21.

Population growth between 1921 and 1931 was approximately 1,590,000 or only slightly greater than in the previous decade. The rate of increase, at 18 p.c., was less than in the period 1911-21 and only a little more than half the rate recorded in the first decade of the century. Also it is significant that the rate of population growth in Eastern Canada was much closer to the rate of growth in Western Canada than in the period 1901-21. In the decade 1931-41 Canada's population increase, at 11 p.c., was the lowest recorded. Immigration over this decade was not much more than 150,000 or only about one-tenth of the number in each decade since 1901. The depressed conditions existing throughout most of the decade also resulted in a sharp falling off in marriages and in births. As a result, only 1,130,000 persons were added to the population of Canada over this ten-year period.

Despite the almost complete cessation of immigration during World War II, the decade 1941-51 was marked by a record growth in population numbers. Excluding Newfoundland, the increase amounted to 2,141,000. The rate of growth was just over

* An outline of the growth of population in Canada since the beginning of the seventeenth century may be found in Vol. I of the 1931 Census. Other accounts of population growth prior to the present century are included in Vol. I of the 1941 Census and Vol. X of the 1951 Census.

18 p.c. or about the same rate as was recorded in the census decade following World War I. Including Newfoundland, the rate of growth of the Canadian population in the period 1941-51 was 22 p.c., raising the Canada total as of June 1, 1951 to just over 14,000,000.

During the first five years of the second half of the present century Canada experienced an outstanding development of its economic resources. Reflecting this expansion, population, which in the ten years preceding the 1956 Census had risen by 3,374,000 or 27.4 p.c.,* continued to increase at a high rate over the years between the 1951 and 1956 Censuses. Slightly more than 2,000,000 persons were added to the population of Canada in this period, a 14.8-p.c. increase in five years, raising the total population to 16,080,791 on June 1, 1956. Net immigration accounted for almost 30 p.c. of the total increase in population since the 1951 Census, and natural increase for slightly over 70 p.c. In no comparable period of time in the past was the absolute size of net immigration as large as in this five-year period. In terms of the relative contribution of net immigration to population growth, only in the first decade of the century—when it accounted for 40 p.c. of the total population increase—did this element play a more important role than in the years since 1951.†

The record of population growth by provinces since 1901 given in Table 1 indicates the rapid expansion that took place in the Prairie Provinces up to 1921 and the slowing down in growth that followed during the 1920's and was greatly accentuated during the period 1931-56. It also shows that the Maritime Provinces as a group showed only a slight gain in population between 1901 and 1931—Prince Edward Island actually losing about 15,000 people over this period—and although a somewhat greater growth was experienced from 1931-51, another slow down occurred between the latter year and 1956; that the rate of population increase in Quebec by decades over the fifty years 1901-51 was consistently greater than in Ontario, the larger gains in the latter province resulting from net migration being more than offset by the higher rate of natural increase in Quebec, but that Ontario had taken the lead by 1956; and that the population of British Columbia recorded consistent and, in some decades, spectacular growth.

* Exclusive of Newfoundland since this province did not come into Confederation until 1949.

† More detailed information on the elements of population growth may be found in 1956 Census Report No. 3-1 *Growth of Population in Canada*. See also Section 2, pp. 195-197 for Intercensal Surveys.

1.—Numerical Distribution of Population by Province, and Percentage Change from Preceding Census, Decennial Census Years 1901-51 and 1956

NOTE.—Populations for the decennial census years 1871, 1881 and 1891 are given in the 1956 Year Book, p. 149. The populations of the Prairie Provinces in 1906, 1916, 1926, 1936 and 1946 will be found in the 1951 edition, p. 131.

¹ Includes Labrador. ² Calculated on the basis of 1,958,409 sq. miles which excludes the land area of Newfoundland. ³ Includes Newfoundland. ⁴ Calculated on the basis of 3,417,193 sq. miles which excludes the land area of Newfoundland.

Subsection 3.—Rural and Urban Population

Before 1951 the population residing within the boundaries of all incorporated cities, towns and villages of a province was classified by the census as urban and the remainder as rural. Since the laws governing incorporation vary among provinces, there was no uniform line of demarcation between the rural and urban population throughout Canada. In the 1951 Census the aggregate number of residents within a given area, rather than provincial legal status, was the main criterion for the rural-urban classification. The population residing in cities, towns and villages of 1,000 or over, whether incorporated or unincorporated, as well as the population of all parts of census metropolitan areas, was defined as urban and that outside such localities as rural. The 1956 Census definition was substantially the same as that used in the Census of 1951 except that the fringe parts of other major urban areas were classed as urban.

A change in the composition of urban size groups was made also for the 1956 Census. At the 1951 Census, each municipality located within the boundaries of a census metropolitan area was allocated to an urban size group according to its own individual size. In 1956, each such municipality was classified to the same urban size group as the total metropolitan area of which it formed a part. In addition, the fringe parts of other major urban areas were included in the tabulations by urban size groups in the same manner, as those of census metropolitan areas.

Table 3 presents the rural and urban population classified by province or territory for 1956. The rural population is further classified by farm and non-farm residence and the urban population by size of locality.

3.—Rural Population classified by Farm and Non-farm, and Urban Population classified by Size Group, by Province, Census 1956

Province or Territory	Rural			Urban Size Groups				
	Farm ¹	Non-farm	Total	1,000 to 9,999	10,000 to 29,999	30,000 to 99,999	100,000 or Over	Total

¹ Excludes 115,168 persons living on farms in localities classed as urban.

Populations of Counties and Census Divisions.—Population totals for counties and census divisions for the census years 1951 and 1956 are presented in Table 4. Corresponding information for the census years 1901-41 is given in the 1952-53 Year Book at pp. 137-141. The 1956 populations of the subdivisions of the counties and census divisions may be found in Bulletins Nos. 1-1 to 1-5 of the 1956 Census of Canada (Catalogue Nos. 92-501 to 92-505), and further details for the earlier census years in *Ninth Census of Canada, 1951, Vol. I.*

For census purposes, metropolitan areas have been established for groups of urban communities that are in close economic, geographic and social relationship. The total population of each of the census metropolitan areas in 1956, with the comparable figure from the 1951 Census covering the same area as in 1956, is shown in Table 6. In this table the metropolitan area has been named after the largest city of the urban group.

6.—Populations of Census Metropolitan Areas at the 1956 Census, with Populations of Same Areas in 1951

Metropolitan Area	Population		Metropolitan Area	Population

¹ Not incorporated in 1951. ² Towns of Corner Brook E., Corner Brook W. and Curling amalgamated to form part of Corner Brook city Jan. 1, 1956. ³ Rural district in 1951. ⁴ Rural municipality of St. Léonard de Port Maurice in 1951. ⁵ Rural municipality in 1951. ⁶ Previous to 1953 called Lac St. Louis. ⁷ Rural municipality of St. Joseph de la Rivière des Prairies in 1951. ⁸ Rural municipality of St. Joseph in 1951. ⁹ Previous to June 16, 1951 called Beauport E. ¹⁰ Improvement district in 1951.

Subsection 4.—Sex and Age Distribution

Sex.—The sex distribution of the Canadian people has been characterized since early colonial times by a preponderance of males although this condition has been greatly modified in more recent years. In 1666 during the early years of settlement by French immigrants 63.3 p.c. of the population were males. In 1784 when British immigration to Canada was commencing there were 54,064 males and 50,759 females and by the middle of the nineteenth century there were 449,967 males to 440,294 females in Lower Canada and 499,067 males to 452,937 females in the more newly settled Upper Canada.

Since Confederation the newer sections of Canada—the west and the northwest—have shown the greatest excess of males. From 1871 to 1941, for Canada as a whole, the proportion of males never dropped below 51 p.c. of the total population whereas for Western Canada it varied between 53 p.c. and 59 p.c. By 1951, however, the proportion of males to the total population had dropped to 50.6 p.c. for Canada as a whole and in 1956 was 50.7 p.c.

9.—Sex Distribution of the Population, by Province, Census Years 1941, 1951 and 1956

NOTE.—Figures for the census years 1871–1931 are given in the 1948–49 Year Book, p. 150.

Age.—The age distribution of a population is fundamental to most, if not all, other analyses, for the age factor influences employment, marriage, birth rates and death rates, education, immigration, criminology, and a multitude of events and activities that are of great importance in the national life.

Recent trends in vital rates and immigration have considerably changed the age composition of the population of Canada. A high birth rate together with a low death rate among children added, between 1951 and 1956, nearly 1,000,000 to the population under 15 years of age and raised the proportion of this group to the total population from 30.3 p.c. to 32.5 p.c. On the other hand, the relative proportion of the working-age groups—persons from 15 to 64 years of age—was 2 p.c. lower at 59.8 p.c. in 1956 than in 1951 when 61.9 p.c. were in this age group. Without the influx of immigrants during the 1951-56 period, the proportion of this productive group would have been much lower since a large part of it consists of the survivors of those born in the 1930's when birth rates were at their lowest. The proportion of persons 65 years of age or over was slightly less than 8 p.c. at both census dates.

Table 10 shows the population of Canada classified by five-year age groups and sex for the census years 1941, 1951 and 1956. The provincial distribution by specified age groups as recorded in the 1956 Census is shown in Table 11.

Subsection 5.—Marital Status

Next to the sex and age distribution of a population, that of marital status is probably most fundamental from a vital, economic and social viewpoint. The number of married females between 15 and 45 years of age is a most significant factor in the fertility of a population; if the proportion of females in this group is small, the expected proportion of births will also be small. In 1956, 64.3 p.c. of all married females were in the age group 15-44 years, as compared with 64.0 p.c. in 1951, 61.2 p.c. in 1941, and 63.5 p.c. in 1931. This trend indicates a movement towards conditions more favourable to a higher birth rate than those that existed during the period of world-wide depression.

The high birth rate of the period 1951-56, which has had such a decided effect on the increase in the total population and on its age composition, has also been an influence on the increase of 15.7 p.c. in the unmarried population. Most of this gain was in the population under 15 years of age. During the same period, the married population increased by 14.1 p.c., widowed by 10.5 p.c., and divorced by 14.9 p.c. Other striking statistics of marital status are the excess of married males over married females (largely owing to a preponderance of male immigrants whose wives had not yet joined them), the great preponderance of widows as compared to widowers, and the large and increasing number of divorced persons.

Subsection 6.—Origins and Birthplaces

Origins.—A population composed of diverse racial stocks gives rise to political, economic and social problems quite different in nature from those of one with a small admixture of foreign elements although, to the extent that certain racial stocks are more readily assimilated than others, the problems are mitigated. It is equally true that the different educational, moral, economic, religious and political backgrounds of a people of mixed origins lend variety and diversity to the national life.

The two basic stocks of the Canadian people are the French and the English; historically the French is much the older and, excepting at the time of the 1921 Census, has always exceeded in numbers any one of the basic British stocks.

For purposes of the census, a person's origin or cultural group is traced through his father. For example if a person's father is German and his mother Norwegian the origin is entered as "German". Wherever possible the origin of a person is established by asking the language spoken by the person or by his paternal ancestor when he first came to Canada.

Census of 1951 data are the latest available on origins of the population.

13.—Origins of the Population, Census Years 1931, 1941 and 1951

NOTE.—Figures for census years 1871-1921 are given in the 1948-49 Year Book, p. 154.

Countries of Birth.—The decennial census collects information on the country of birth of immigrant arrivals in Canada and province of birth of Canadian born. For persons born outside of Canada the country of birth as constituted at the date of the census is recorded. Table 14 gives the total population by countries of birth for the census years 1931, 1941 and 1951.

14.—Countries of Birth of the Population, Census Years 1931, 1941 and 1951

NOTE.—Figures for census years 1871-1921 are given in the 1948-49 Year Book, p. 158.

Subsection 7.—Religious Denominations

At each decennial census the numbers of persons attached to any religious denomination, as reported by the persons enumerated, have been recorded. The distribution of the principal denominations for the census years 1931, 1941 and 1951 is given in Table 15. No later data are available.

15.—Principal Religious Denominations of the Population, Census Years 1931, 1941 and 1951

NOTE.—More detailed figures for census years 1871–1921 are given in the 1948–49 Year Book, p. 155.

¹ Includes "Hutterite".

² Includes "Other Greek Catholic".

Subsection 8.—Languages and Mother Tongues

Tables showing the numbers of persons speaking one, both or neither of the official languages of Canada and showing mother tongues of the population at the date of the 1951 Census are given in the 1957-58 Year Book at pp. 138-139. Further details may be found in Vol. I of the 1951 Census of Canada.

Subsection 9.—Households, Families and Dwellings*

Households and Families.—Only the principal statistics on households and families recorded at the Census of 1956 are given here—additional summary figures are given in the 1957-58 Year Book at pp. 141-143 and detailed information may be found in 1956 Census Bulletins 1-13 to 1-20 inclusive (Catalogue Nos. 93-501 to 93-508).

The total number and average size of households and families for census years 1951 and 1956 are shown in Table 16 for provinces and for cities of 30,000 population or over. These figures show a consistent trend towards larger families in 1956 as compared with 1951, although the average size of household remained relatively stable over the five-year period.

* Census definitions are briefly as follows: **DWELLING.**—A *Dwelling* is defined as a structurally separate set of living premises with private entrance from outside the building, or from a common hallway or stairway inside. A *Single Detached Dwelling* is a house containing one dwelling unit and completely separated from any other building. *Apartments and Flats* include dwelling units in apartment blocks, in duplexes or triplexes, and in structurally converted houses, and living quarters in business premises, schools, etc. In determining the number of *Rooms* in a dwelling, only those suitable for living purposes are included. A *Crowded Dwelling* is defined as one in which the number of persons exceeds the number of rooms occupied.

HOUSEHOLD.—A *Household* is a person or group of persons occupying one dwelling unit, the number of households thus equalling the number of occupied dwellings.

FAMILY.—A *Family* is a husband and wife (with or without children) or a parent with an unmarried child (or children) living together in the same dwelling. Unmarried sons and daughters under 25 years of age and living with their parents are classed as children, as are wards and guardianship children under 21 years of age.

16.—Households and Families, and Persons per Household and Family, by Province and City of 30,000 Population or Over, Census Years 1951 and 1956

¹ Exclusive of institutions, hotels, camps, etc.² Exclusive of the Yukon and Northwest Territories.

In Table 17 households are classified according to the number of persons, the number of family groups, and the number of lodgers they contain. This information is shown for Canada as a whole with comparable figures from the 1951 and 1956 Censuses. It will be seen that the two-person household was the most common household size in both years, and in 1956 two-person households represented nearly 22 p.c. of all households. The percentage of multiple-family households and households with lodgers showed a decrease between 1951 and 1956. This is consistent with the fact previously stated that, although families showed a noticeable increase in size between 1951 and 1956, there was no corresponding increase in size of household. (For later sample-survey figures on families, see p. 199.)

Dwellings.—Since a census of housing was not taken in 1956, the latest census information on dwellings is for the year 1951. Table 18 indicates the changes that took place in certain dwelling characteristics during the decade 1941 to 1951.

Statistics relating to household conveniences in 1951 generally reflect an increasing level of prosperity in both urban and rural areas within the 1941-51 period. In 1951 over 60 p.c. more homes had indoor plumbing, electricity and furnace heating than in 1941. There was also a substantial increase in the number of homes equipped with such conveniences as mechanical refrigerators, electric vacuum cleaners, telephones, radios and passenger automobiles. While much of this advance may be attributed to general prosperity, part of the trend is accounted for by increasing urbanization of the Canadian population and the availability of modern conveniences to rural areas. (For later sample-survey figures on household conveniences, see p. 199.)

Subsection 10.—Blind and Deaf Population

A table showing the number of totally blind and totally deaf persons in Canada at the time of the 1951 Census is given in the 1957-58 Year Book at p. 145. Further details on the blind and deaf population may be found in Vol. II of the 1951 Census of Canada. No later official information will be available until the 1961 Census.

Section 2.—Intercensal Surveys

Subsection 1.—Population Estimates and Movement

Intercensal estimates of the population have many uses. They are necessary to the calculation of costs of certain economic and social legislation. Business, educational and welfare organizations utilize population estimates in planning future development. They constitute a base for vital statistics rates, per capita figures of production and trade, and other analyses. They have proved useful for estimates of labour force and other population characteristics of data collected in sample surveys.

Estimates are constructed for the total population of Canada and for each province and become available about the date to which they apply—June 1 of each year. Population estimates by provinces are also available on a quarterly basis. The estimates of

population begin with the preceding census counts, to which are added the births of the intervening census year or years and from which the deaths are subtracted; immigrants are added and emigrants subtracted. On emigration no precise information is available. The DBS receives yearly from the United States the number of persons who gave Canada as country of last permanent residence before entering the United States as immigrants (see Chapter on Immigration and Citizenship, Part I, Section 3) and from the United Kingdom's Board of Trade the number of emigrants from Canada taking up permanent residence in the United Kingdom. Such data, however, are not available from other countries, though the proportion of total emigrants to all other countries is small. Family allowance statistics showing the number of migrant families by provinces are used in estimating interprovincial shifts in population.

The following statement shows the data used in preparing the annual estimates for 1957, 1958 and 1959. The next succeeding census serves as a basis for revision of the annual estimates.

Item	Period		
	1956-57	1956-58	1956-59
Population, Census 1956.....	16,081,000	16,081,000	16,081,000

Population at end of period.....	16,589,000	17,048,000	17,442,000

¹ Final figures used where available and registrations substituted for remaining period.

19.—Estimates of Population, by Province, as at June 1, Intercensal Years 1941-59

NOTE.—At every census the previous post-census estimates, made at June 1 each year, are adjusted to the newly recorded population figures. Figures for all provinces for 1941, 1951 and 1956 and for the Prairie Provinces for 1946 are census figures. Figures for 1867-1904 will be found in the 1936 Year Book, p. 141; for 1905-30 in the 1946 edition, p. 127; and for 1931-40 in the 1952-53 edition, p. 143.

Table 20 shows the natural increase and the total population increase according to the census for Canada and the provinces in the periods 1931-41, 1941-51 and 1951-56. The difference between the natural increase and the total increase in population during a period represents the difference between inward and outward movements, i.e., net migration. The net migration data shown for provinces indicate the net movement of population arising partly from interchange of population between provinces and partly from persons entering and leaving the country.

The earlier movement of population on the North American Continent from east to west has not been apparent since the 1920's. Although British Columbia has continued to show population gains from migration since 1931, much of this gain has been at the expense of the Prairie Provinces. While the three Prairie Provinces lost by migration about 248,000 persons between 1931 and 1941 and somewhat more from 1941 to 1951, they gained in the period 1951-56. Manitoba lost over 109,000 population between 1931 and 1951 but only 152 persons between 1951 and 1956. Saskatchewan has been a consistent loser since 1931, losing on the average over 15,000 a year during the 1930's, almost 20,000 a year during the 1940's and just under 8,000 a year during the 1950's. Alberta lost over 40,000 persons in the decade 1931-41 but only about 7,000 in the next decade and gained close to 65,000 in the five years 1951-56. British Columbia gained through migration at the rate of about 8,000 persons a year during the 1930's, about 23,000 a year during the 1940's and about 27,000 a year in the first half of the 1950's. On an absolute basis Ontario received more people through migration than did British Columbia but, in relation to its larger population, the gain was only about one-third as important. Most of Ontario's growth through migration was from immigration rather than interprovincial movement of population. Quebec had a slight loss between 1931 and 1951 and a considerable gain in the next five years. Nova Scotia gained population through migration during the 1930's but has been losing ever since; the Maritimes as a whole lost 138,000 persons over the quarter-century.

20.—Numerical Changes in the Population of the Provinces through Natural Increase and Migration 1931-41, 1941-51 and 1951-56

Subsection 2.—Age and Sex Estimates

Table 21 gives estimates of the population of Canada and the provinces by age group and sex as of June 1, 1959. The method followed in preparing these estimates was much the same as that used in calculating the population estimates, described on p. 196. These estimates are subject to revision following the 1961 Census.

21.—Estimated Population classified by Age Group and Sex, by Province,
as at June 1, 1959

Subsection 3.—Dwelling and Family Estimates

Annually since 1953 a sample survey on dwellings and household facilities and equipment has been conducted in conjunction with the monthly labour force survey. More than 35,000 households chosen by random sampling methods in about 135 different areas are interviewed. Results of the 1959 survey are presented in Table 22.

22.—Dwelling Characteristics, Sample Survey, May 1959

Characteristic	No.	P.C. of Total	Characteristic	No.	P.C. of Total
Occupied Dwellings ¹'000	4,303	100.0	Dwellings with—concluded

¹ Excludes households in the Yukon and Northwest Territories; households of Indians on reserves; such collective-type households as those living in hotels, large lodging houses, institutions, clubs and camps. ² For exclusive use of household.

Estimates of the number of families in Canada and the provinces are also prepared annually. The estimates for 1958 were based on family data secured from the May 1958 sample survey of the labour force and population estimates for 1958.

The estimated number of families in Canada in June 1958 was 3,953,000, an increase of 247,000 or 6.7 p.c. since the 1956 Census. The average number of persons per family showed no change from the 3.8 reported by the 1956 Census and only a slight increase from the 3.7 reported by the 1951 Census. The number of children in families increased by 643,000 in the years between June 1956 and June 1958 and showed an average annual increase of 237,000 since June 1951. It is interesting to note that since 1951 there has been an increase in the percentage of families having three children or more at home and a decrease in the percentage of families having fewer than three children, or no children.

23.—Estimates of Family Characteristics, June 1958 compared with Censuses of 1951 and 1956

(Exclusive of the Yukon and Northwest Territories)

Characteristic	Census 1951	Census 1956	Estimate 1958	Increase 1951-56	Increase 1956-58

5 or more children....."	7.7	..	8.4

Subsection 4.—Marital Status Estimates

The estimated total population of Canada, excluding the Yukon and Northwest Territories, on June 1, 1958 was 17,015,000, of whom 11,365,700 or 66.8 p.c. were 15 years of age or over. The estimated total of males 15 years of age or over was 5,743,800, of whom 1,765,200 or 30.7 p.c. were single, 3,767,600 or 65.6 p.c. were married and 211,000 or 3.7 p.c. were widowed or divorced. The estimated total of females 15 years of age or over was 5,621,900, of whom 1,308,300 or 23.3 p.c. were single, 3,741,100 or 66.5 p.c. were married and 572,500 or 10.2 p.c. were widowed or divorced.

The trend towards earlier age at marriage during the war and postwar period was reflected in the sharp rise in the proportion married in the age group 15-24 years, where the percentage increased from 8.0 in 1941 to 15.6 in 1958 for males and from 21.5 in 1941 to 33.8 in 1958 for females.

Estimates of marital status also reflect the continuing excess of married males over married females, and the large number of widows as compared with widowers in the population, previously noted as a striking feature in the results of the 1956 Census. It is estimated that in 1958 the number of widows exceeded the number of widowers by 355,000.

24.—Estimated Population classified by Marital Status, Age Group and Sex, as at June 1, 1958

Section 3.—The Native Peoples of Canada

Two small segments of the population are given special attention because they, in point of time and origin, are the most truly Canadian of the country's citizens and because they, of all the people in the land, are the least able to cope with the changing way of life now being forced upon them.

The Indians.*—The Indians of Canada, the fastest-growing ethnic group in the country, live on 2,226 tracts of land that have been reserved for their use and in several outside communities. There are nearly 600 Indian "bands" scattered from Prince Edward Island in the east to the Queen Charlotte Islands in the west, from southern Ontario north to Aklavik. It is believed that when the white man arrived there were 200,000 Indians roaming in what is now Canada. Half a century ago they had dwindled to fewer than 90,000 and were considered to be a dying race, but by the end of 1959 their number was roughly 180,000 and they are now increasing at the rate of 3 p.c. a year, compared with an over-all Canadian average natural growth of 2 p.c. Since health services have drastically reduced infant mortality and prolonged life in middle age, it is estimated that by 1968 the Indian population will have reached 228,000 of whom only 35 to 40 p.c. will be living on reserves.

A census of Indian population is taken at five-year intervals. The numbers recorded at the censuses of 1949 and 1954 together with an estimate as at the end of 1958 are given in Table 25.

25.—Indian Population, by Province, Departmental Censuses 1949 and 1954, and Estimate as at Dec. 31, 1958

In proportion to their numbers, the Indians of today form one of the most varied populations on earth. In the southern parts of Canada many follow the essentially rural-type economy of their non-Indian neighbours. Some work in factories, in offices, or at individual trades and some are lawyers, doctors, nurses, teachers or businessmen. However, at the other end of the economic scale, the Indian who, in the course of history, has been isolated and is at present living on essentially unproductive areas, generally follows a modified, food-gathering type of existence not too different from that of his ancestors. He fishes, hunts and traps. He lives in his log cabin. Often he sets up his tent in summer. True, he wears factory-made clothes, eats dehydrated and canned food from the store,

* Prepared in the Editorial and Information Division, Department of Citizenship and Immigration, Ottawa.

propels his canoe with an outboard motor and often flies by bush 'plane to his trapline. Nevertheless, this is just the veneer of the white man's civilization. Underneath, his culture is vastly different and all-too-often misunderstood. Living on a variety of levels between that of the Indians of the cities and that of the Indians of the woods are many Indian bands, each with its own set of problems.

Faced with the inexorable pressures of increasing population and marginal resources, the Indian Affairs Branch of the Department of Citizenship and Immigration, which is responsible for the administration of all matters affecting the welfare of Indians, has set two essential objectives for the next decade—a greater measure of self-responsibility for people on the reserves, and more help for those who wish to make their livelihood in non-Indian society. Neither objective can be attained through force. The pace of developments must be determined by the Indians themselves, rather than superimposed by others or processed in accordance with a time-table based on administrative convenience.

It is the young people who will decide in which direction the future of the Indian race lies. At present they are caught between two worlds, one representing the old Indian culture with its own thought-patterns and attitudes and the other the fast-paced, technological society of the mid-twentieth century. In the face of this conflict, the older people, set in their ways, have tended to withdraw and the young people are often confused.

The Indian has different social values which conflict with the culture of the non-Indian world outside the security of the reserve. Contrary to people in a Western nine-to-five-o'clock society seeking security and credit, the Indian thinks of time, savings and the future in quite different terms. This is especially so where his contacts with the white man have been superficial but less so in areas where intermingling of Indian and non-Indian groups is commonplace.

The Indian Affairs Branch reaches into the lives of Indians most deeply by its educational policy. This is, briefly, to give every child the best schooling he can absorb and in accordance with his needs to provide tuition, board and personal expenses while he is attending a non-Indian high school, a teachers' college, a nursing or vocational course or a university.

Four types of schooling are provided: elementary day schools on the reserves, residential schools, hospital schools and seasonal schools for children whose families are still partially nomadic, especially while winter trapping. Residential schools are primarily for children from broken homes or whose parents are unable to give them proper care and direction and for the children of nomadic peoples whose way of life makes day school attendance impracticable. Other residential pupils live in settled communities where scattered home locations or substandard socio-economic patterns also prevent successful day school attendance.

During the past decade there has been a definite movement towards the integration of Indians in non-Indian provincial and private schools, a policy strongly advocated by the Indian Affairs Branch. During the 1958-59 school year, 21 p.c. of the Indian children at school were receiving their education with non-Indians as compared with only 6 p.c. ten years previously. This policy has been welcomed by the majority of Indians and non-Indians, though some groups have expressed certain reservations, not about integration as such but about the pace set by the Branch. They claim that many Indians are not ready for integrated education and suggest a slower policy.

Integrated education is accomplished by two methods. Where it is possible for Indian children to attend local non-Indian schools, the Indian Affairs Branch, with the consent of the parents, asks the school board to accept them and pays tuition costs. Where there is not enough space or where large numbers of Indian pupils are involved, the Branch signs an agreement for a joint school and pays a share of the cost of additional classrooms. In British Columbia, one out of every three Indians goes to a non-Indian school; in Nova Scotia, one in four; in Quebec and Ontario, one in four and a half. Integration has progressed least on the prairies.

Indian students, no matter what school they attend, face more problems than most Canadians. Because many do not speak English fluently when they first go to school they usually take longer to cover grade one. By Canadian standards they are generally older by the time they pass grade eight, not because they are less intelligent or through any inherent disabilities, but because of language and cultural difficulties. Their habits of communication, their processes of reasoning, their attitudes towards competition, their learning and living experiences in a rural, food-gathering, reserve-type economy are basically quite different from those of other Canadian children. Nevertheless, an increasing number of Indian children are entering high school—over 2,200 in the academic year 1958-59 compared with only 600 ten years previously. Vocational enrolment has increased in the same period from 41 to 412, and university enrolment from nine to 40.

At the end of formal schooling, the Indian must make a crucial decision—to return to or stay on the reserve, or to earn a living in a wider Canadian society. Integrated schooling helps him to accept the latter choice more readily. A placement service, with officers at Vancouver, Edmonton, Saskatoon, Winnipeg, North Bay, Toronto, Quebec City and Amherst, was set up by the Indian Affairs Branch in 1957 to assist these young people. Jobs are found for selected young students who want to work in the larger cities and they are counselled and guided as they cross the bridge into non-Indian society.

Apart from these younger people, a great many Indians both live and work off the reserves, or live on the reserve and work outside. The Mohawks of Eastern Canada have made a name for themselves as high-steel workers. British Columbia Indians are known as reliable and hard-working longshoremen, and have long been successful salmon and herring fishermen. Naskapis from northern Quebec are part of the working force at the iron mines at Schefferville. The Dokis Band near North Bay live on rich timberlands and are loggers and pulp cutters. Walpole Island men in southern Ontario are skilled workers in a boat-building factory at Algonac, Michigan. These are random examples which indicate that, given the education, training and the opportunity, the Indian can compete on equal terms with others in industrial society. Prejudice on the part of employers is lessening and those who employ Indians do not consider them to be different from other workers after they have adjusted to regular working hours.

In the more isolated areas of the northern Laurentian Shield and the Mackenzie District, the Indians depend largely on trapping, domestic fishing and hunting for a living. As expert outdoorsmen and conservationists, they have helped, for example, to restore the once-depleted beaver population from Quebec to Saskatchewan and put it on a sustained-yield basis. In some areas of the North, the Indians have been assisted in launching commercial fishing programs. Here the main problem is transportation, and private operators and the provincial and federal governments have been assisting them by flying their catches to railhead for shipment to the consuming markets in both Canada and the United States.

Superimposed on these various strata of employment are traditional methods used seasonally by the Canadian Indian to supplement his income: potato-picking in Maine, berry-picking in the States of Washington and Oregon, wild-rice gathering in southern Manitoba, northwestern and central Ontario, frog-picking, seneca-root gathering, basket weaving and other traditional Indian crafts.

No matter where he works or what his employment, the Indian must face the problem of adjustment and make his own choice. If he wants to participate in the non-Indian world he may still keep his sense of identity, for integration is the policy, not assimilation, and he may remain a member of his band. On the other hand, if he wishes to continue living on his reserve, the Indian Affairs Branch will provide him with community and housing assistance, financial help through revolving loan funds in farming and fishing and business, relief grants where necessary and assistance in developing leadership.

Much of the leadership among the Indians today stems from the band councils. Each band chooses its own representatives. A few still do so by the old tribal systems—usually electing for life—but the majority have adopted the elective system, with the chief and councillors holding office for two years. All councils may make by-laws. They may, for example, regulate traffic, prevent trespass of cattle, construct water courses, roads, bridges, etc., and protect fur-bearing animals, fish and game.

Twenty-seven bands have reached the stage where they may make money by-law to raise funds through taxation of property owned by Indians on a reserve. Generally, these bands are fairly progressive and are rapidly learning administrative procedures. However, a band must apply for permission to pass money by-laws and, for various reasons of their own, there are several bands in Canada who prefer not to accept this responsibility. Band councils also make decisions on the use of their own money, capital—usually procured from the sale of land in the past—which is held in trust by the Federal Government. Capital expenditures are for long-term improvements on reserves.

DISTRIBUTION OF
INDIAN AND ESKIMO POPULATIONS

Up to Jan. 1, 1960, three bands had asked for, and been granted, the right to spend their own revenue funds, which accrue usually from interest on trust funds held by the Government. Each band draws up an annual budget, submits it to the Minister of Citizenship and Immigration for general approval, and then handles its own funds through its own treasurer in a manner similar to that of any rural municipality. Tyendinaga near Belleville in Ontario was the first band to apply for this right. Two other Ontario bands, Walpole Island near Wallaceburg and Moravian near Chatham, quickly followed suit.

These are signs of a desire among the Indians to take over more responsibility for their own affairs and although the process may be long and sometimes painful it is the policy of the Government to give them every encouragement. To equalize their status with other Canadian citizens, a Bill was passed by the Federal Parliament on Mar. 31, 1960* extending to all Indians the right to vote at federal elections. Previously, while all adult Indians could vote for their own band councils, and those living in British Columbia, Manitoba, Ontario, Newfoundland, Nova Scotia and the Northwest Territories had the provincial or territorial franchise, only Indian veterans and Indian people established in non-Indian communities had the right to vote in federal elections. The granting of the federal franchise to the Indian does not in any way affect the rights and privileges to which he is entitled.

The Indian has much to offer to Canadian industry and culture. He has been falsely regarded for too long as a "ward" of the Government, when he is in fact a citizen. He has, it is true, certain rights and privileges given him because of historical circumstance but he shares, for example, in most of the social welfare benefits extended to other Canadians, such as family allowances. In 1958-59, 4,539 Indians received old age security, 1,762 old age assistance, 302 disabled persons' allowance, 287 blind persons' allowance and 310 provincially administered and financed mothers' allowance.

In co-operation with provincial authorities, private, foster-home or institutional care is provided when required for children needing care, juvenile delinquents, crippled and unemployable persons and old people. In Ontario, for example, arrangements have been made for the extension of the services of Children's Aid Societies to Indian reserves. In 1959 the "ration system" of relief formerly in use was abolished and indigent Indians were made eligible for assistance by cheque on substantially the same basis as non-Indians. The amount of relief assistance was increased and placed on a sliding scale, varying with the cost of living, thus protecting Indians in remote areas where food costs are high. These changes were designed to place more responsibility on Indian families to manage their own affairs, to remove the stigma of relief as much as possible and to maintain the morale and self-respect of persons who must receive assistance.

The health of Indians is under the care of the Indian and Northern Health Services of the Department of National Health and Welfare. The Department maintains seventeen hospitals, 41 nursing stations with four to ten beds and 108 health centres where treatment, but no bedside care, is provided. The most dramatic advances have been made in the field of child care and in the treatment of tuberculosis. In 1958 there were fewer than 3,500 Indians under treatment for tuberculosis compared with 5,900 in 1955. As each province adopts a general hospital insurance plan, the Indians have been included. The policy is to avoid distinction between the Indians and other citizens of Canada.

The Eskimos.†—Eskimos are the only native people who live in both America and Asia and there are no more than 50,000 of them in the world. In Canada the Eskimo population is about 11,500, very thinly dispersed across the sprawling top of the Continent. The main groups live along the northern coast of the Western Arctic, on Baffin Island, largest in the Arctic Archipelago, and in northern Quebec. In only four centres—Aklavik and Inuvik near the mouth of the Mackenzie River, Fort Chimo on the southern point

* Not yet proclaimed at time of going to press.

† Prepared by Mrs. Irene Baird, Information Section, Department of Northern Affairs and National Resources, Ottawa.

of Ungava Bay, and Great Whale River on the east side of Hudson Bay—do Eskimos and Indians share the same community. By tradition, treeline is the southern boundary for the Inuit while for the Indian people treeline has been a limit north of which they have not chosen to live.

Today the Canadian Eskimos and the vast forbidding land in which they live have begun to emerge as a fresh force in national development. The more than a million and a half square miles that comprise the Yukon and Northwest Territories and include all the Arctic islands extending northward from the mainland to the North Pole are being actively appraised for their resource potential. The geological structure underlying the tundra and the polar seas is being determined and recorded. The government is building roads over muskeg and permafrost, wrestling—slowly and at great cost—the ground transportation problem, which is the toughest and most basic of all the problems of northern development. The oil industry, already with a substantial investment in the sub-Arctic, is vitally interested in increasing that investment by searching the Arctic regions for new sources. Over 180,000,000 acres in the sedimentary basins of the Yukon and Northwest Territories are now under oil and gas exploration permit. Appraising the resources of the North and developing and marketing those resources will take longer and most certainly will cost more than such developments elsewhere in Canada, but for a region that has for so long lain unknown and untouched, the changes of the past few years are rapid indeed, and basically responsible for those changes is the present-day efficiency and versatility of air transport.

Few areas of the country, even in the barren wastes of the North, are now inaccessible. Although thousands of square miles are still considered remote, the main centres are only flying time away from the great commercial cities of the south; Frobisher Bay, for example, is a mere day's flight from Montreal, and Aklavik about nine hours from Edmonton. Multi-engined aircraft are flying the polar routes to and from Europe. The meteorological and communication stations that dot the North, the survey crews and the small settlements are served by aircraft so that landing strips are Main Street to much of the Arctic and movement by air more familiar to the inhabitants than any other form of transport.

These happenings in the North are some of the reasons why life for the Inuit is changing and some of the reasons why new opportunities for employment are opening up for them and why they must be trained to take advantage of them. Change has not come to the Eskimos in all areas at the same pace. Social change seldom works that way but comes in a series of segments, large and small, which, when merged together, resolve into new patterns. But regardless of speed, no aspect of development north of treeline has aroused keener public interest than the position of the Eskimo people. Their fellow Canadians, though sometimes divided as to how the Inuit should be equipped to adapt to change, are united in wanting them to have all the help they need. Inuk, as a man, is known to relatively few persons outside the Arctic, but he belongs to a race that is exceptionally well regarded.

The Canadian Government, through the Department of Northern Affairs and National Resources, the agency having over-all responsibility in the North, and the Indian and Northern Health Services of the Department of National Health and Welfare, has initiated vigorous programs to bring education and medical care to every northern resident who can be reached. The Royal Canadian Mounted Police also carries out field duties for both departments. The Arctic has always tested to the limit the resourcefulness and courage of those who live and work there and it makes no exceptions of race. To keep contact—over some 900,000 sq. miles—with an Eskimo population that still often chooses to live the life of the hunting camps, calls for the co-operation of all who share the high latitudes with them—northern service officers, teachers, doctors, nurses, missionaries, traders, radio operators and weather men.

Radio and air patrols maintain administrative contact. The first of an experimental system of emergency units has been set up in the Keewatin District. Insulated, radio-equipped, and stocked with food and medical supplies, these units will be established

close to the larger hunting camps with one or more of the local Eskimos trained to operate them. Then if some emergency strikes the camp, the Eskimos have the means to communicate their plight and food and medical supplies to carry on with.

Eskimos following their traditional way of life are being given new ideas to strengthen their security without interfering with their self-reliance. Conservation is still an abstract conception to a people accustomed to taking game while it is there and, when it is no longer there, moving off in search of it. But a community of hunting Eskimos on the west shore of Hudson Bay has found that conservation makes good sense and that the practice of it can increase the yield of the land and can keep them in food when supplies are scarce. The Keewatin Re-establishment Project was set up to help the Eskimo families help themselves. Working with the guidance of an experienced field officer and the results of biological and wildlife research, they have learned a practical aid to making a better living. The principle of providing for tomorrow does not come naturally to traditional hunters like the Eskimos and Indians but both are intelligent enough to grasp that it can be turned to profitable account.

The advantages of the co-operative have also been introduced recently in the Arctic. The idea of pooling labour and sharing the harvest is traditional with the Inuit and they have recognized that a method of producing, processing and marketing which has been profitable for other Canadians could serve them too, particularly in areas where the fishermen, when working singly, were on relief. With some help from government officers the first two co-operatives were organized—the George River Eskimo Fishermen's Co-operative on Ungava Bay and a co-operative at Port Burwell. In the Frobisher Bay area, too, Eskimo fishermen have taken the first steps toward forming a co-operative.

At George River in 1959 co-operative harvesting produced some 18,600 lb. of Arctic char, and at Frobisher Bay about 15,000 lb. Char is in great demand as a gourmet fish in the "south" and the 1959 catch brought a net return of about 83 cents a pound to the Eskimos. The Port Burwell co-operative will be producing in 1960. In this region also, char is plentiful and of fine quality and cod is a useful source of food to the local Eskimos. The George River people—about 25 families—live on the edge of treeline and have plans to start a sawmill operation. They have used local logs to build a community hall and plans for a school are being drawn up. Eventually they hope to put up permanent homes.

In marketing the first season's catch, the co-operative fishermen faced one obstacle that ingenuity alone could not solve. Produce does not reach markets unaided; above all it must be kept fresh. This problem was resolved by the purchase of a 15-ton freezer through the Eskimo Loan Fund, a Fund started in 1957 by the Department of Northern Affairs. Fittingly enough, the first loans from the Fund were made to a group of Eskimo settlers who, in the tradition of earlier Canadian pioneers, set out to make their homes in unknown and almost empty country. A small group from Port Harrison, where game was scarce, volunteered to be moved to the High Arctic where it was more abundant and, with loan funds, were helped to re-establish themselves. Eskimos use the Fund to buy whalers and fishing boats, hunting and other equipment that will contribute towards better living. Experience has shown that they are excellent risks and the labour involved in such operations contributes to the development of the country.

For the Eskimos who have chosen to enter wage employment now becoming available to those who are prepared for it, training is provided—sometimes on the job, as was the case during the construction stages of Inuvik, sometimes in northern schools, and sometimes outside the North. Vocational or trades training is regarded as so vital to the earning-power of all who live in the Northwest Territories that it is built right into the government's school curriculum. All northerners now attend the same schools—schools that range from the Sir John Franklin School at Yellowknife, which offers a wide range of vocational courses and where students may qualify for university entrance, to single classroom units in remote Eskimo communities.

Teaching in the Arctic can be rigorous—though in some parts of the North it is hardly more so than in rural schools in the northern half of the provinces. But whatever its demands there is never any lack of applicants—although choosing the right ones must be done with discrimination. With so many teachers willing to accept the challenge of an Arctic posting, qualifications can afford to be the highest in Canada, and they are.

There are close to 50 schools in the Northwest Territories and among those opened in 1960 are two interesting new ventures for the North. A new school at Fort Simpson will include the first classroom for the study of agricultural science, and quarters in the old school building will accommodate hard-of-hearing and sight-saving classes. The 1959 vocational training program included many trade skills for students of all ages. One Eskimo girl took on-the-job-training as an air hostess from a northern airline and now flies between Montreal and Frobisher Bay. Another Eskimo air hostess who trained as a nurses' aide some years ago flies between Winnipeg and Churchill. Interesting too is the fact that the first oil-drilling crew working north of the Arctic Circle included three Eskimos who had been trained in Calgary as oil-workers.

Trainees who go "south" on courses are chosen with care and competition is keen for the privilege. The last group of Eskimos to go outside the Arctic in 1959 went to the Royal Canadian Electrical and Mechanical Engineers School at Barriefield in southern Ontario to take a four-month course in power-plant operation, a skill in great demand in northern communities. Most of these trainees were school caretakers learning to handle school heating and lighting plants. Others were taking more advanced training.

Eskimos can suffer by having other Canadians expect too much of them, or expect it too quickly. But it is difficult to withhold admiration from a race with the innate resourcefulness to adapt as quickly as they do to callings so radically different from their traditional way of life. The first group to tackle hard-rock mining, for example, performed with profit to themselves and to the North Rankin Nickel Mining Company which employed them, and brought credit to their race.

Neither is it difficult to think highly of a race whose talent with a knife and a lump of stone has been acclaimed so widely, yet who, themselves, have always regarded the gift as something fortuitous—a hobby, a creative pleasure to be enjoyed in one's spare time. Not all Eskimo carving is distinguished; some of it is not even good. But enough of it is both to have had an extraordinary impact. Eskimo art has come out of its environment free of any influence save the day-to-day struggle for life of a people, and has stepped into the front rank of the world's primitive art, becoming, as it should, an important source of revenue for its creators. And for many Eskimos who, through illness or other causes, are not able to hunt or perform heavy labour, it has offered a new avenue of productiveness. At the Eskimo Rehabilitation Centre at Frobisher Bay, Eskimo carvers may offer their work for sale, receive guidance if they ask for it, and obtain a supply of stone since none is available locally. The Eskimo art shop at the Frobisher airport is a thriving business.

No one can put creativeness in a man if none is there, but if he has a spark of talent he can be helped to gain confidence and extend his range. This is what is going on at the Eskimo Craft Centre at Cape Dorset, Baffin Island. Working with a gifted instructor, Eskimos have already produced one art form—stone block and seal-skin pictures—that may eventually compete in popularity with the stone carvings. A seal-skin print was selected for presentation to Queen Elizabeth when she visited Canada in the summer of 1959. The artists use paints made from pigments mixed with seal oil and brushes of polar bear hair. Designs are cut out of the skin and transferred to paper by hand-colouring. One stencil can make as many as thirty prints.

For the past five years Northern Affairs exhibits—in addition to exhibitions of carvings—have introduced to the "south" everything from parkas and mukluks to walrus harpoons. Eskimos are not mass-producers and some time will elapse before enough Arctic handicrafts are available for wide sale. But the popularity of the Eskimo-produced goods that have been brought out of the North for sale in Canadian and American cities shows definitely that the market is there.

As has been said many times, the North has a way of stimulating resourcefulness and ingenuity. At Aklavik in the Western Arctic, a trapping centre cruelly slashed by falling fur prices and synthetics, a pilot training project was undertaken in 1959. Its aim was to combine two valuable local resources—fur and the native skill of Eskimo women at tailoring fur garments. With the help of the Vocational Education Supervisor for the Northwest Territories a small group of Eskimo women were introduced to "southern" methods of fur-working. Before long they had begun to meet the local demand for fur parkas and headgear, seal-skin mukluks and muskrat mittens, with a professional touch. This is a modest fur factory as factories go but it has at least one asset that all strive for—a healthy backlog of orders. At the close of the year some \$10,000 in orders stood on the books, enough to keep the Eskimo seamstresses busy all winter and their families off relief.

Like all pilot projects this one has an eye on bigger things. As the number of trainees grows and the value of their output increases, this could become an Eskimo fur co-operative. Or it might be used in conjunction with the Inuvik Rehabilitation Centre to train the physically handicapped to a new productiveness, like the Centre at Frobisher Bay. Community needs will probably be the decisive factor.

By tradition, Eskimos are a people who prefer to "write by tongue"—story-tellers who have handed down their past, partly from choice and partly from necessity, in the form of speech. But the printed word has come to them at last. Early in 1959 the first all-Eskimo magazine, *Inuktituk* (The Eskimo Way of Life) made its appearance in two editions—syllabics for the Eastern Arctic—Roman script for the Western.

Outside the Arctic the voice of the Inuit in Canada has been silent in the conduct of Eskimo affairs but in May 1959, when the Eskimo Affairs Committee met in Ottawa, the long silence was broken. A race accustomed to listening to other people speak for it was in the nation's Capital to speak for itself. The Committee is an advisory body, reporting to its Chairman, the Commissioner of the Northwest Territories. It is not large as working committees go, and has been meeting only in recent years. But the presence of Eskimo representatives from Western, Central and Eastern Arctic who bluntly, and with dignity, voiced the views of the Eskimo community, gave the 1959 meeting an impact as fresh and sharp as wind off the barrens.

This was the first time in Canada that the Inuit have sat around a conference table with senior officials of government, religion and industry and examined with them the changes taking place in the Arctic way of life and the role of the Eskimo people in that change. It was a modest, almost tentative step in a new direction, yet the beginning of a partnership that will become more and more an accepted part of the administration of Eskimo affairs. For years, in various capacities, Eskimos have worked for all three types of agency represented on the Eskimo Affairs Committee and their advice on local problems has often been sought, but never in the past has there been such formal recognition of what Eskimo experience can contribute to the future of the North.

The Inuit have their normal complement of human frailties but dependence on other people is not one of them. Although, like other Canadians, the Eskimo is eligible for the benefits of social security and government assistance, he is by temperament a resourceful and self-directing man. If he had not sprung from this kind of stock, Eskimo affairs would by now have been of more interest to the archivist than to the administrator.

The Government invited the Eskimos to sit at the conference table to say what was in their minds, and they did, giving voice to their desires for more education and vocational training, and for the opportunity to qualify for better jobs and assume a greater measure of responsibility in the conduct of their own affairs. If the voice of the Eskimo came through with clarity so did the voice of other Canadians. And what did the Inuit learn from this? They learned more about what other Canadians are trying to do for, and with, them; why some things are going well and others not so well. They learned that what

their fellow countrymen most wish for the future of the Eskimo is that, like themselves, he be equipped to choose the kind of life he wishes to live where, and how, he wishes to live it.

Section 4.—Statistics of World Population

World population figures given in Table 29 are from the United Nations *Population and Vital Statistics Report* for October 1959 and, except as otherwise noted, are official mid-year estimates for 1958. The area figures are from the United Nations *Statistical Yearbook, 1958*.

Estimated Population of the World by Continents.—The statement below presents adjusted estimates of the 1958 mid-year population of the world by continental divisions. These aggregates do not coincide exactly with the sum of the figures for individual countries because they include, in addition, adjustments for over- and under-enumeration, over-estimation, categories of population not regularly included in the official figures, and approximations for those countries that have not provided official 1958 data. The estimates are as follows:—

<i>Continental Division</i>	<i>Number</i>
Africa ¹	230,000,000
North America.....	256,000,000
South America.....	134,000,000
Asia ²	1,592,000,000
Europe ³	418,000,000
Oceania.....	15,800,000
WORLD TOTAL.....	2,852,000,000 ⁴
Commonwealth countries.....	683,600,000

¹ Excludes Syria, a province of the United Arab Republic.
² Excludes U.S.S.R. Includes Syria and Asiatic Turkey.

³ Excludes U.S.S.R. Includes European Turkey.

⁴ Includes an allowance for population of the U.S.S.R.

		SECTION 2. CANADIAN CITIZENSHIP STATISTICS.....	230

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

PART I.—IMMIGRATION AND EMIGRATION*

The history of immigration and the Immigration Act and Regulations is dealt with in detail in a special article entitled "Developments in Canadian Immigration" appearing in the 1957-58 Year Book at pp. 154-176. Supplementing that material is an article on the "Integration of Postwar Immigrants" at pp. 176-178 of the 1959 edition.

Section 1.—Immigration Policy and Administration

Since the end of the Second World War it has been the policy of the Government of Canada to stimulate the growth of the population by selective immigration. Efforts are made to choose immigrants of prospective adaptability to the Canadian way of life and to admit them at such times and in such numbers as employment conditions warrant.

Federal immigration policy is governed by the provisions of the Immigration Act and Regulations, which permit the admission to Canada of British subjects by birth or naturalization in the United Kingdom, Australia, New Zealand or South Africa; citizens of Ireland and of the United States; and French citizens born or naturalized in France or on the islands of St. Pierre and Miquelon. All, however, must be in good health, be of good character, and have sufficient means to maintain themselves until they have secured employment. Other classes of admissible immigrants consist of persons considered to be desirable in the light of social and economic conditions prevailing in Canada at the time, and possessed of qualifications for successful integration. Also admissible are wives, husbands, unmarried children under 21 years of age, fathers over 65 and mothers over 60 of legal residents of Canada who are in a position to receive and care for their dependants, provided such dependants satisfy the requirements of the Immigration Act and Regulations. Agreements are in effect with the governments of India, Pakistan and Ceylon for the admission annually of 300, 100 and 50 persons, respectively, from those countries in addition to certain close relatives.

The Immigration Branch of the Department of Citizenship and Immigration administers the Immigration Act and Regulations. Twenty-seven visa officers are located abroad at London, Liverpool, Leeds, Bristol, Glasgow, Belfast, Dublin, Paris, Brussels, Berne, The Hague, Copenhagen, Cologne, Berlin, Hamburg, Munich, Stuttgart, Vienna, Oslo, Stockholm, Helsinki, Lisbon, Rome, Athens, Tel Aviv, New Delhi and Hong Kong. Four offices in the United States—at New York, Chicago, Los Angeles and Minneapolis—

* Sections 1 and 2 of this Part were revised under the direction of the Deputy Minister, Department of Citizenship and Immigration, Ottawa.

furnish information and counselling but do not issue visas. Personnel at all posts are kept in close touch with economic conditions in Canada and thus are able to advise immigrants regarding prospects for successful settlement. Examination of immigrants and visitors is carried out at 343 ports of entry on the Canadian coasts, at points along the International Boundary, and at certain airports.

A primary objective of administration is satisfactory settlement. The Federal Government assists immigrants in establishing themselves in the Canadian community through the work of the Immigration Branch Settlement Service, the Canadian Citizenship and Canadian Citizenship Registration Branches and other government agencies, and co-operates closely with several voluntary agencies having the same objective.

Section 2.—Immigration Statistics

Postwar Immigration.—The extent of immigration to Canada in any period is affected both by domestic conditions and by conditions abroad. However, these influences are seldom immediately decisive. News of good economic conditions in Canada predisposes people in favour of this country but, because the immigration process usually takes from six to eighteen months, actual immigration is not always fully coincidental with the economic situation, so that immigration may at times be slight in good years but appear unduly heavy in less buoyant periods. The time-lag caused by selection, medical examination and documentation is unavoidable. Transportation is often another delaying factor and to these considerations must be added the effect of seasonal unemployment in Canada, which tends to discourage immigration during the months from November to April.

Since the end of World War II there have been wide annual fluctuations in immigration to Canada caused mainly by economic and political factors. Many of the persons who arrived in 1946 and 1947 were the wives and children of Canadian service men and their numbers were dictated by the availability of shipping. In 1948, as more shipping became available, the number of immigrants doubled. In addition to the large movement from the United Kingdom, thousands of displaced persons were admitted and Germans and Italians began to come forward in appreciable numbers after having been removed from the enemy alien category. As the high level of immediate postwar economic activity levelled off, there was a drop of 30,000 in the number of immigrants entering in 1949 compared with 1948, and a further drop of 20,000 in 1950. Then the outbreak of war in Korea created a new stimulus to industry and caused shortages of labour; at the same time fear of war in Europe made Canada seem a desirable haven. Thus in 1951 immigration increased nearly threefold and remained in excess of 150,000 for the following three years. Very significant numbers of Germans and Italians were admitted and the gap between them and the British Isles group was narrowed. Another minor economic setback in 1954 caused immigration to fall in 1955 by some 45,000 but, with the return of better times in North America and the deterioration of the political situation in Europe, immigration again rose by 55,000 in 1956. The Hungarian revolution and the Suez crisis of 1956 had a sharp impact on Canadian immigration in 1957 when 282,164 persons were admitted, including 31,643 from Hungary and 108,989 from the United Kingdom. This was the largest number of immigrants to enter Canada since 1913. The conclusion of the Suez affair and the suppression of the Hungarian revolt restored some measure of calm in Europe. Canada's economy suffered a recession in 1956 and 1957 while Europe's economic position improved, as a result of which only 124,851 immigrants came to Canada in 1958. The United Kingdom's recovery from the war and its aftermath was reflected in the fact that for the first time in the postwar years the British Isles group of arrivals was not the largest—persons from Italy were in first place, numbering 27,043 compared with 24,777 from the United Kingdom.

Immigration from the United Kingdom during the period 1946-59, inclusive, was 561,059 representing 29.5 p.c. of the total immigration to Canada in that period. Other large groups came from Italy, numbering 239,129 and representing 12.6 p.c. of the total; Germany, 224,000 representing 11.8 p.c.; Netherlands, 141,971 representing 7.5 p.c.; United States, 133,878 representing 7.0 p.c.; and Poland, 87,167 representing 4.6 p.c.

In each postwar year, except 1958 and 1959, the British Isles group was the largest, ranging from a low of 12,669 in 1950 to a high of 108,989 in 1957. Immigrants from the United States formed the second largest group in 1946 and 1947, and from Poland in 1948, 1949 and 1950. Persons from Germany filled this position from 1951 to 1954, in which years persons from Italy and the Netherlands also arrived in substantial numbers. In 1955 and 1956 persons from Italy were in second place but Hungarians took that position in 1957. Immigrants from Italy headed all groups in 1958 and 1959. During the whole postwar period, immigration from the United States has remained relatively constant, ranging from a high of 11,474 in 1946 to a low of 7,393 in 1948; the annual average for the period was 9,563.

Total immigration to Canada for the years 1946-59, inclusive, was 1,901,119. The yearly totals for this period are shown in Table 1, together with annual figures back to 1913, the peak year of immigration into Canada.

1.—Immigrant Arrivals, 1913-59

NOTE.—Figures for 1852-93 are given in the 1942 Year Book, p. 153, and for 1894-1912 in the 1948-49 edition, p. 175.

Admissions by country of last permanent residence are given in Table 2 for the years 1955-59 only. During that five-year period 30.7 p.c. of the immigration flow came from the United Kingdom and Ireland, 55.7 p.c. from Continental Europe, 6.8 p.c. from the United States and 6.8 p.c. from all other countries.

2.—Immigrant Admissions by Country of Last Permanent Residence, 1955-59

NOTE.—Comparable figures for 1946-49 are given in the 1951 Year Book, p. 143, for 1950-52 in the 1956 edition, p. 182 and for 1953 and 1954 in the 1959 edition, p. 179; figures in less detail for 1939-45 appear in the 1950 edition, p. 186.

Other analyses of the content of the immigration movement in recent years are given in Tables 3 to 9. The numbers of persons refused admission at ports of entry and those deported from Canada in the years 1957-59 are shown in Table 10.

Sex, Age and Marital Status.—In the ten-year period 1950-59 adult males comprised 41.0 p.c. of the immigrant arrivals, adult females 33.5 p.c. and children under 18 years of age the remaining 25.5 p.c. Without relation to age, 54.4 p.c. of the newcomers were males.

3.—Sex Distribution of Immigrants as Adult Males, Adult Females and Children, 1950-59

NOTE.—Figures from 1930 are given in the corresponding table of previous Year Books beginning with the 1946 edition.

Year	Adult Males	Adult Females	Under 18 Years		Total
			Males	Females	
	No.	No.	No.	No.	No.
1950.....	30,700	24,172	10,287	8,753	73,912
1951.....	95,818	53,239	24,348	20,986	194,391
1952.....	66,083	53,443	23,766	21,206	164,498
1953.....	68,269	56,425	23,153	21,021	168,868
1954.....	64,551	51,690	19,980	18,006	154,227
1955.....	42,425	40,120	14,403	12,998	109,946
1956.....	67,880	55,574	21,661	19,742	164,857
1957.....	115,765	92,202	38,461	35,736	282,164
1958.....	44,008	48,655	16,622	15,566	124,851
1959.....	37,110	41,891	14,366	13,561	106,928

In 1959, 75.7 p.c. of the males and 78.9 p.c. of the females arriving were 15 years of age or over as compared with 75.9 p.c. and 78.8 p.c. respectively in 1958. Of those arriving in 1959 who were 15 years of age or over, 50.8 p.c. were married, 43.3 p.c. were single and 5.5 p.c. were widowed or divorced. The total number of single males exceeded the number of single females by 3,305 but there were more females than males in the widowed and divorced categories. In the single class, males were 11.7 p.c. more numerous than females, the numerical superiority being particularly heavy in the age group 15-29 years.

¹ Includes a few minor groups, such as German, French, Italian, etc.

² Reported as Swiss origin but evidently one of the constituent races

Destinations and Occupations.—Upon arrival in Canada, immigrants are asked to state their intended destination. According to these records, Ontario absorbed by far the highest proportion of arrivals in the four-year period 1956-59—51.4 p.c. of all the males and 54.0 p.c. of all the females. Quebec was the second most important province of destination, receiving 20.8 p.c. of the males and 20.3 p.c. of the females. The proportions intending to settle in British Columbia were 11.9 p.c. and 11.5 p.c., respectively; in the Prairie Provinces 13.0 p.c. and 11.6 p.c., respectively; and in the Atlantic Provinces 2.0 p.c. and 2.0 p.c., respectively. The provincial distribution has changed little from year to year throughout the whole postwar period.

¹ Includes 2,571 males and 1,312 females whose destination was unknown.

In like manner, immigrant arrivals are asked to record the occupations which they intend to follow in Canada. Approximately 50.1 p.c. of the persons admitted in 1959 declared that they would enter the labour force. The other 49.9 p.c. were wives, children and other dependants or were retired persons. Of the male workers, 13.9 p.c. were classed as professional and managerial, 13.3 p.c. were in agricultural occupations, 4.7 p.c. in service occupations, 31.4 p.c. in manufacturing, mechanical and construction trades, and 24.1 p.c. were general labourers. Almost 50 p.c. of the female immigrants entering the labour force were intending to follow service occupations. Details are given in Table 9.

Deportations.—Persons unable to meet the requirements of the Immigration Act and Regulations may be refused admission to Canada upon applying at ports of entry, and certain classes not considered suited to the Canadian way of life may be deported. Regulations covering rejections and deportations are given in the 1957-58 Year Book, pp. 173-174.

10.—Refusals and Deportations, by Cause and Nationality, 1957-59

1954.....	4,516	1959.....	5,243

Section 3.—Emigration Statistics

Emigration from Canada is an important factor tending to offset to some extent present and past immigration activities. The major outward movement has always, of course, been to the United States and that movement, both of native-born Canadians and of Europeans who originally migrated to Canada, has attained considerable proportions at certain periods. No Canadian statistics on emigration are available but Table 11 gives figures taken from the annual reports of the Immigration and Naturalization Service of the United States Department of Justice. These figures show the numbers of persons entering the United States from Canada during the years 1949-58 with the expressed intention of establishing permanent residence in that country. They do not include persons travelling for pleasure, even for extended periods of time, holders of border-crossing cards (normally issued to persons living in border areas of Canada but working in the United States) or casual tourist crossings in these same areas.

Of the 45,143 persons entering the United States from Canada in the year ended June 30, 1958, 30,055 were native-born Canadians—13,403 males and 16,652 females. Only about one-quarter, or 7,678 of the total native-born emigrants were males in the productive age group 20-59 years. By occupation, the largest group of the total of 30,055 native-born persons was the professional or technical group which numbered 3,564; clerical or kindred workers numbered 3,435, and 1,950 were classed as craftsmen or

foremen. On the other hand, 16,124 persons or nearly 54 p.c. of the total were classed as housewives, children and others with no occupation. Altogether, 38 p.c. of the total were children under 20 years of age.

11.—Persons Entering the United States from Canada, Years Ended June 30, 1949-58

NOTE.—Includes only persons who have declared their intention of remaining permanently in the United States when applying for a visa (see text above).

PART II.—CANADIAN CITIZENSHIP*

Naturalization procedures and events leading to the passing of the Canadian Citizenship Act are given in the 1951 Year Book, pp. 153-155.

Section 1.—The Canadian Citizenship Act

The Canadian Citizenship Act came into force on Jan. 1, 1947, its purpose being to give a clear definition of Canadian citizenship and provide an underlying community of status for all the people of Canada. Since Jan. 18, 1950, the administration of Canadian citizenship has been the responsibility of the Department of Citizenship and Immigration. The provisions of the Act and its several amendments are outlined in some detail in the 1955 Year Book, pp. 177-181. More briefly, they are given in the following paragraphs.

Natural-Born Canadian Citizens, Born before Jan. 1, 1947.—The Act defines the two categories of a natural-born Canadian citizen as (1) a person born in Canada or on a Canadian ship or aircraft; (2) a person born outside of Canada before Jan. 1, 1947, if the responsible parent (the father or, where the father is deceased or where the child is born out of wedlock, the mother) is a Canadian citizen, if he was, on Jan. 1, 1947, either a minor or had, prior to that date, been lawfully admitted to Canada for permanent residence and had not, before that date, acquired the citizenship or nationality of another country.

The Act provides that a person in the second category will cease to be a Canadian citizen on attaining the age of 24 years or on Jan. 1, 1954, whichever is the later date, unless he has his place of domicile in Canada at such date or has, before such date and after reaching the age of 21 years, filed a declaration of retention of Canadian citizenship.

Natural-Born Canadian Citizens, Born after Dec. 31, 1946.—A person born outside of Canada subsequent to that date, whose responsible parent is considered a Canadian citizen pursuant to the terms of the Canadian Citizenship Act, is a Canadian if his birth is registered with the Registrar of Canadian Citizenship within two years of its occurrence or within such extended period as the Minister may authorize in special cases.

* Prepared in the Citizenship Registration Branch under the direction of the Deputy Minister, Department of Citizenship and Immigration, Ottawa.

The person who becomes a Canadian citizen in such manner automatically ceases to be a Canadian citizen on reaching the age of 24 years unless he complies with the requirements as set out for a person born outside of Canada before Jan. 1, 1947, who was still a minor on that date.

Canadian Citizens other than Natural Born.—Before the 1953 amendments to the Citizenship Act, the only persons who acquired Canadian citizenship on Jan. 1, 1947 through the transitional clauses of Sect. 9 were persons who were naturalized in Canada before that date, British subjects who had Canadian domicile at the commencement of the Act and women lawfully admitted to Canada and married prior to Jan. 1, 1947 whose husbands would have qualified as Canadian citizens if the Act had come into force before the date of marriage. Sect. 9 was amended on June 1, 1953, so that a British subject who had his place of domicile in Canada for at least 20 years immediately before Jan. 1, 1947 need not comply with the requirements of Canadian domicile provided he was not under an order of deportation on Jan. 1, 1947.

Status of Married Women.—Since the commencement of the Canadian Citizenship Act, a Canadian woman does not lose Canadian citizenship upon marriage to a non-Canadian and a non-Canadian woman does not become a Canadian citizen upon marriage to a Canadian citizen. However, a Canadian woman who marries a non-Canadian whose country of allegiance considers her to have acquired its nationality upon marriage may file a Declaration of Renunciation of Canadian citizenship if she wishes to divest herself of her Canadian citizenship. A non-Canadian woman who marries a Canadian citizen must apply to the court for a certificate of citizenship. If she is a citizen of another Commonwealth country she may apply direct to the Minister. The one concession as to the qualifications applicable in both instances is a residence of only one year in Canada rather than the prescribed five years of Canadian domicile.

A Canadian woman who married a non-Canadian prior to Jan. 1, 1947, and ceased to be a British subject may regain her status and be readmitted to Canadian citizenship upon application therefor, whether or not she is a resident of Canada.

Status of Minor Children.—The minor child of a Canadian citizen other than a natural-born Canadian may receive a certificate of Canadian citizenship upon application therefor by his or her responsible parent, the *de facto* guardian, or the mother if she has custody of the child. Provision is also made in the Citizenship Act for the granting of a certificate of citizenship to a minor child in special circumstances, e.g., to a child whose responsible parent is not a Canadian citizen but who has been admitted to Canada for permanent residence. Provision is made for the granting of a certificate to a person who has been adopted or legitimated and who has been admitted to Canada for permanent residence, if the adopter or the legally recognized father is a Canadian citizen.

Loss of Canadian Citizenship.—Canadian citizenship may be lost as follows:—

- (1) A Canadian citizen who when outside of Canada and not under disability (minor, lunatic or idiot) acquires by a voluntary and formal act other than marriage the nationality or citizenship of a country other than Canada. This does not apply if that country is at war with Canada at the time of acquisition but in such a case the Minister may order that he cease to be a Canadian citizen. The purpose of this is to hold the person, if deemed necessary, to his obligations as a Canadian.
- (2) A Canadian citizen who under the law of another country is a national or citizen of such country and who serves in the armed forces of such country when it is at war with Canada. This does not apply if the Canadian citizen became a national or citizen of such country when it was at war with Canada.
- (3) A Canadian citizen, other than natural born or one who has served in the Armed Forces of Canada in time of war, or other related circumstances, who resides outside of Canada for ten consecutive years without maintaining substantial connection with Canada, loses his citizenship automatically, but the period of absence may upon application be extended beyond the ten years for good and sufficient cause.

Loss of Citizenship by Revocation—Applicable Only to Naturalized Persons.—The citizenship of a Canadian citizen other than a natural-born Canadian citizen may be revoked by the Governor in Council if, upon a report from the Minister, he is satisfied that such Canadian citizen, having been charged with the offence of treason under the Criminal Code or with an offence under the Official Secrets Act, has failed or refused to return to Canada voluntarily within such time as may be prescribed in a notice sent by the Minister to such person at his last known address and has not appeared at the preliminary inquiry into such offence or at the trial of such offence, or both as the case may be; or has obtained a certificate of naturalization or of Canadian citizenship by false representation or fraud or by concealment of material circumstances.

Doubt as to Loss of Citizenship.—Where in the opinion of the Minister a doubt exists as to whether a person has ceased to be a Canadian citizen, the Minister may refer the question to the Commission referred to in Subsection (4) of Section 19 for a ruling and the decision of the Commission or the Court, as the case may be, shall be final.

Loss of Citizenship by Revocation—Applicable to Both Natural-Born and Naturalized Persons.—The Governor in Council may in his discretion order that any person shall cease to be a Canadian citizen if, upon a report from the Minister of Citizenship and Immigration, he is satisfied that such person has, when not under a disability (1) acquired voluntarily the citizenship of a foreign country (other than by marriage), (2) taken or made an oath, affirmation, or other declaration of allegiance to a foreign country, or (3) made a declaration renouncing his Canadian citizenship.

Section 2.—Canadian Citizenship Statistics

Data on countries of allegiance and origins of the population were not collected at the 1956 Census so that the latest information available is that for the 1951 Census. Results of that census show that 96.9 p.c. of the people of Canada were Canadian citizens; that 0.7 p.c. were citizens of other Commonwealth countries; 1.7 p.c. of European countries; 0.1 p.c. of Asiatic countries; 0.5 p.c. of the United States; and 0.1 p.c. of other countries. Table 1, classifying the 1951 population by country of allegiance and origin, shows that 98.0 p.c. of the persons of British Isles origins and 99.7 p.c. of those of French origin owed allegiance to Canada. Corresponding percentages for other European and Asiatic origins were 89.3 p.c. and 78.7 p.c., respectively.

Citizenship Certificates Issued.—In 1958, 133,560 Canadian Citizenship Certificates were issued as compared with 141,915 in 1957. During 1958, the Canadian Citizenship Registration Branch recorded 5,321 certificates of registration of births abroad, 629 declarations of intention, 120 declarations of retention of Canadian citizenship and 18 petitions for resumption of Canadian citizenship. Certificates issued free to persons who had had active military service numbered 425. Corresponding figures for 1957 were 4,422 registrations of births abroad, 751 declarations of intention, 152 declarations of retention, 11 petitions for resumption and 691 certificates issued free to persons who had had active military service.

Characteristics of Persons Granted Citizenship Certificates in 1958.—Comparable detailed statistics showing the characteristics of persons granted citizenship certificates are available since 1953; such characteristics include age, marital status, occupation, period of immigration, residence and previous nationality.

Of the 84,183 persons granted citizenship in 1958 about 2 p.c. had immigrated to Canada before 1921, 4 p.c. in the period 1921-40, 21 p.c. in the period 1941-50 and 73 p.c. since 1950. Regionally these new citizens were distributed as follows: 1 p.c. in the Atlantic Provinces, 16 p.c. in Quebec, 55 p.c. in Ontario, 16 p.c. in the Prairie Provinces and 11 p.c. in British Columbia. Just over 82 p.c. of them resided in urban centres.

Just over 16 p.c. of the persons naturalized during 1958 had been citizens of Germany, 13 p.c. had been citizens of Italy, 13 p.c. had been citizens of the Netherlands, 12 p.c. had owed allegiance to a British Commonwealth country, 11 p.c. reported former allegiance to countries now parts of the U.S.S.R., and Poland was country of allegiance for almost 10 p.c. Most of the persons designated as "stateless" were born in Poland, the U.S.S.R., Yugoslavia, Hungary, Germany, Czechoslovakia and Austria.

Of the males granted citizenship certificates in 1958, 28 p.c. were employed in manufacturing and mechanical occupations, 14 p.c. were employed in construction, 12 p.c. were labourers in other than primary industries, 11 p.c. were in service, 9 p.c. were in professional occupations, 7 p.c. in agriculture, 4 p.c. in transportation and communication and 4 p.c. in proprietary and managerial occupations. Of the females granted certificates, 56 p.c. were homemakers; among those employed outside the home, 28 p.c. were in manufacturing and mechanical occupations, 28 p.c. in clerical occupations and 25 p.c. in service occupations.

SECTION 4. NATURAL INCREASE.....	258	VITAL STATISTICS.....	267

NOTE.—*The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.*

Vital statistics provide a record of population development—a measure of the pace of growth, marriage and fertility trends, the distribution of people in and entering the various age groups, the relative importance of each of the causes of death, and so on. The continuity of such data gives a constant guide to the planning, operation and evaluation of a variety of national activities, particularly in the fields of public health, education, community planning and various types of business enterprise.

This Chapter gives a fairly detailed coverage of the vital statistics information available, gives life tables for males and females and presents a comparison of the principal Canadian vital statistics rates with those of other countries. In making international and interprovincial comparisons of birth, death and marriage rates, it is important to note that part of the differences observed over a period of years as between countries, provinces or local areas may be caused by differences in the sex and age distribution of the populations involved. Similarly, rates for any one area may be affected by changes in such distribution.

The population data upon which the rates shown in this Chapter are computed are given in Chapter III, in DBS census bulletins, and in reports on intercensal estimates of population. Births and deaths are classified by place of residence (births according to the residence of the mother) and marriages by place of occurrence.

The history of the collection of vital statistics in Canada is covered in the 1948-49 Year Book, pp. 185-188. Detailed information is given in *Vital Statistics* (Preliminary Report) (Catalogue No. 84-201), *Vital Statistics of Canada* (Catalogue No. 84-202) and in other regular and special reports; in addition, certain unpublished data are available on request.

Section 1.—Summary of Vital Statistics

Table 1 gives a summary of the principal vital statistics of the provinces of Canada from 1931 to 1958 and Table 2 shows certain vital statistics for urban centres having at least 10,000 population at the date of the 1956 Census. Corresponding data for 1921—when the collection of national statistics was initiated—to 1930 are shown in previous issues of the Canada Year Book.

* Revised in the Vital Statistics Section, Health and Welfare Division, Dominion Bureau of Statistics.

1.—Summary of Principal Vital Statistics, by Province, 1931-58

NOTE.—Figures for the years 1921, when the collection of national statistics was initiated, to 1930 are given in previous editions of the Year Book.

¹ As at the 1956 Census: residents only.² By place of occurrence.³ Per 1,000 live births.

Section 2.—Births*

The Canadian birth rate in 1921 was 29 per 1,000 population. As a rate of 35 is very high for countries of modern western civilization, the Canadian rate had probably not fallen far, nor for long, before 1921. It fell continuously until 1937 when it reached a low of 20 but, as a result of economic recovery and the War, it rose to 22 in 1940, 24 in 1943 and a record high of nearly 29 in 1947. Since then it has fluctuated between 27 and 28.5 and in 1958 stood at 27.6.

The birth rates in most provinces followed similar trends but there were some regional differences in the birth rate pattern in recent years. Although all provinces had record high rates immediately following World War II, average birth rates in Ontario and the western provinces were higher during 1951-55 than those for the 1946-50 period, while those for Quebec and the Maritimes were lower. In fact, Ontario, British Columbia and Alberta had record high crude birth rates during the past three to four years.

* For international comparisons, see Section 7, pp. 267-268.

It is popularly assumed that the Province of Quebec has the highest birth rate in Canada, but Table 1 shows that since the late 1930's or early 1940's Newfoundland and, in some years, New Brunswick have had higher rates than Quebec. In 1958, Newfoundland had a crude rate of 33.8 followed by Alberta with a rate of 30.7, Quebec 29.0 and New Brunswick 28.4; Manitoba and British Columbia had the lowest rates at 24.9 and 25.6, respectively. However, these crude rates are based on total population and therefore do not reflect the fertility of the women who are of reproductive age in the different provinces. A more accurate measure of fertility is the rate based on the number of married women in the population in the main reproductive ages, 15 to 44 years. The numbers of children born in 1957 and 1958 to every 1,000 married women in this age group were as follows:—

Province	1957	1958	Province	1957	1958
Prince Edward Island.....	223	214	Saskatchewan.....	189	188
Nova Scotia.....	194	189	Alberta.....	194	194
New Brunswick.....	229	216	British Columbia.....	163	163
Quebec.....	218	212			
Ontario.....	169	166	CANADA*.....	188	184
Manitoba.....	174	168			

* Excludes Newfoundland and the Territories for which data are not available.

On this basis, New Brunswick, Prince Edward Island and Quebec had the highest fertility rates and British Columbia and Ontario the lowest.

Also contrary to popular impression, since 1953 more babies were born each year in Ontario than in the Province of Quebec; in 1958, 152,637 babies were born to Ontario mothers as compared with 141,396 to Quebec mothers. Altogether, 470,118 children were born in Canada in 1958, a record number.

Sex of Live Births.—Wherever birth statistics have been collected they have shown an excess of male over female births. No conclusive explanation of this excess has yet been given. Nevertheless it is so much of an accepted statistical fact that a proper ratio of male to female births has become one of the criteria of complete registration. The number of males to every 1,000 females born in Canada has varied since the middle 1930's between 1,047 and 1,067 annually and averages around 1,057. Provincial sex ratios vary much more widely because of the relatively small number of births involved—the smaller the total number of births, the greater the chance of wide sex-ratio variations from year to year. Another commonly acknowledged fact in many countries—although there is no generally accepted explanation for it—is that the male ratio appears to rise during or shortly after major wars. This seems to have happened in Canada between 1942 and 1945 when the ratio rose to an average of 1,064 during these four years as compared with averages of 1,054 between 1931-41 and 1,057 since 1946.

3.—Sex Ratios of Live Births, 1931-58

NOTE.—Figures for Newfoundland are included from 1949 and those for the Yukon and Northwest Territories from 1950.

Hospitalized Births.—In 1958 almost 92 p.c. of all Canadian births occurred in hospital. Table 4 indicates the rise in hospitalized births in each province since 1931. Although the percentages have increased steadily in all provinces, they still vary widely from province to province. The existence of prepaid or provincially sponsored hospital, maternity or medical care plans in some provinces, the unavailability of hospital facilities in others—particularly in remote rural areas—and preference for home delivery in some local areas are among the factors accounting for provincial variations in this respect. The noticeable increases in hospitalized births within recent years in those provinces that previously had the lowest proportion may be partly the result of increased hospital services being provided in those areas.

Births in Urban Centres.—Table 2, pp. 238-240, shows the number of births in 1958, as compared with the average for 1951-55, to mothers residing in urban centres of 10,000 population or over.

Illegitimacy.*—In 1958, 4 p.c. of the live births in Canada were illegitimate. This percentage is low compared with that of many countries of the world. In the five-year period 1926-30 it was 3 p.c., whereas the average of the years 1951-55 was 3.8 p.c.

* The term "illegitimate", for statistical purposes, does not refer to births conceived out of wedlock but to those in which parents reported themselves as not having been married to each other at the time of the birth or the registration of the birth.

Stillbirths.*—As is shown in Table 6, about 7,000 fetuses, where the mother was pregnant at least 28 weeks, are born dead annually. The 6,726 stillbirths in 1958 represented a rate of 14.3 for every 1,000 fetuses born alive. The stillbirth rate has been decreasing steadily and has been cut by more than half over the past quarter-century. Although the variations between provincial rates have never been wide, rates in some provinces have been reduced more than in others. The stillbirth rate among unmarried mothers has been consistently higher than that among married mothers, but this difference has been narrowing in recent years.

* In recent years, provincial laws define a stillbirth, as here compiled, as the birth of a fetus after a 28-week gestation which, when completely separated from the mother, "does not show any sign of life"; in earlier years, they include only those of 28-week gestation which showed no sign of "breathing".

Multiple Births.—Approximately one confinement in 90 in Canada results in the birth of more than one child as compared with one in 85 several years ago—in other words the chances of a confinement resulting in the birth of more than one child are fewer now than formerly. Other facts illustrated by Table 7 are that the proportion of stillbirths is higher among multiple than among single births and is about twice as high for twins and between three and five times as high for triplets.

Fertility Rates.—Sex and age distribution of the population is an important factor in determining birth, death and marriage rates. More than 99 p.c. of the children born are to women between the ages of 15 and 50, so that, as noted earlier, variations in the proportion of women of these ages to the population as a whole will cause variations in the crude birth rates of different countries or regions even though the fertility of women at each age may be the same. Measures of fertility which are independent of the sex and age distribution of the population have therefore been devised. The best known of these are age-specific fertility rates—either per 1,000 *total* women* or per 1,000 *married* women in these age groups—and reproduction rates.

Ages of Parents.—Age of parents is an important variable in any analysis of birth statistics. The distribution of legitimate and illegitimate live births by age of the parents is given in Table 8, and for stillbirths in Table 9, as well as the average age of parents.

More than 6 p.c. of the legitimate children born each year are born to mothers under 20 years of age, in about one-third of the births the mother is under 25 years, and in almost two-thirds, under 30 years; in over 47 p.c. of all births the father is under 30 years of age. On the other hand, over one-third of the illegitimate infants born are born to mothers under 20 years of age and an additional one-third to mothers under 25 years.

* Available from DBS annual report, *Vital Statistics* (Catalogue No. 84-202).

Table 9 illustrates the fact that the risk of having a stillborn child increases with the age of the mother. Although stillbirth rates for mothers of all ages have been declining in recent years, they continue to be three times as high among mothers of 40-44 years and about five times as high among those over 45 years as for mothers under 30.

Order of Birth.—Table 10 shows the order of birth of all live-born infants in 1958 according to age of the mother. As would be expected, 26,915 or three out of every four of the 35,912 infants born to mothers under 20 years of age were first children, whereas almost six out of every ten of the children born to mothers of 20-24 years were second or later children. This is a reflection of the earlier marriages and heavy fertility of recent years.

Table 11 summarizes the pattern of family formation since 1931. The results of the immediate postwar 'baby boom' are obvious—57.9 p.c. of the infants born in 1947 were first or second children while fewer than half of the 1958 babies were first or second children.

Section 3.—Deaths*

The Canadian death rate has moved downward from 10.3 per 1,000 of the population in 1931 to 8.2 for each of the years 1954 to 1957 and to a record low of 7.9 for 1958. Table 1, pp. 236-237, shows that this decline has been apparent in varying degrees in all provinces. The generally low rates in the Prairie Provinces are partly the result of their younger average population; the uniformly higher rate in British Columbia is mainly attributable to a high proportion of people in the older age groups.

Subsection 1.—General Mortality

Age and Sex Distribution of Deaths.—There has been a considerable reduction in infant mortality over the past 25 or 30 years, although more deaths still occur in the first year of life than in any other single year. Of the 104,517 deaths occurring in 1931, 25,737 or almost one-quarter were of children under five years of age and over three-quarters of those were of children under one year of age. Of the 135,201 deaths in 1958, 16,327 or 12 p.c. were of children under five years of age and, of those, 14,178 or nearly 87 p.c. were under one year. Most of the reduction took place among children over the age of one month but there was also a notable decrease in all childhood ages up to five years.

The trend in the over-all mortality pattern has been steeply downward since the early 1920's, the most important reduction being in the childhood and early adult ages. In 1931 over 19 p.c. of all male deaths were of persons five to 45 years of age; in 1958 only a little over 10 p.c. of the deaths occurred in this age group. Among females in the five to 45 age group the proportion dropped from just under 22 p.c. to 8 p.c. in the same comparison. While death rates for males up to age 45 have been roughly halved during the past 25 years, those for females under 45 years have been reduced as much as three to four times. In other words, the death rates for females at every age have declined more than those for males; the male rates have almost always been consistently higher than those for females and the differences are widening.

These reductions in the mortality rates in early and middle years of life have had the effect of increasing the number of people in the older age groups and raising the average age at death. In 1931 the average age at death of males was 43.1 years and of females 44.8 years; by 1958 this had advanced to 58.4 years and 61.4 years, respectively. These trends are indicated clearly in Table 12.

* For international comparisons, see Section 7, pp. 267-268.

Deaths in Urban Centres.—Table 2 on pp. 238-240 shows the number of deaths in 1958 for urban centres of 10,000 population or over. Without a knowledge of the age composition of each centre it is difficult to compare rates for various centres. The migration of young people from rural areas to some urban centres and of older people to other centres creates a favourable situation for a low or high rate as the case may be. However, despite differences in the age factor, some urban areas have very low death rates compared with other centres of the same size and with other areas in the same province.

Causes of Death.—Table 13 shows the deaths and death rates in Canada grouped according to the International Abbreviated List of 50 Causes. About 80 p.c. of the deaths are caused by diseases of the heart and arteries, cancer, accidents, diseases of early infancy, the respiratory diseases—tuberculosis, pneumonia and influenza—and nephritis.

MAJOR CAUSES OF DEATH

RATE PER
100,000 POPULATION

* INCLUDES: DISEASES OF HEART (INCL. RHEUMATIC FEVER) AND ARTERIES, INTRACRANIAL LESIONS, CHRONIC NEPHRITIS.

The rise in the average age at death has already been noted (p. 248). Deaths from causes that mainly affect children and young adults have declined. Diphtheria for example has been almost wiped out and tuberculosis has been greatly reduced. On the other hand the aging of the population has increased the proportion of deaths from certain causes that affect older people. Thus, cancer and diseases of the cardiovascular-renal systems now account for a substantially larger proportion of all deaths than formerly.

These trends indicate the remarkable success that has attended the attack by health authorities on the infective and contagious diseases which in the past have constituted such a great hazard in the early and young adult years of life. They have similarly served to emphasize the emergence of the chronic and degenerative conditions of later life as the targets towards which the public health programs of the future will be directed. In effect, Canada has shared the experience of most western nations in exchanging a high mortality in younger life for high morbidity in older age groups.

The Chart on p. 251 shows death rates for the major cause groups from 1931-58.

Subsection 2.—Infant Mortality

Table 1 on pp. 236-237 and Table 14 following show the striking improvement that has taken place in the rate of infant mortality during the past quarter-century. Although 70,912 of the 2,269,085 children born in the years 1954-58 died before reaching their first birthday, 142,382 others lived who *would have died* at the rate prevailing in the period 1926-30.

Table 14 shows that mortality among male infants is 25 to 30 p.c. higher than that among female infants for Canada as a whole, with wider variations for the individual provinces. For the country as a whole in 1958, of every 1,000 infant boys born alive, 34 died before reaching their first birthday, whereas out of every 1,000 infant girls 26 died within one year of their birth. As already pointed out, there are on the average 1,057 males born to every 1,000 females, but because male infant mortality is higher the excess of males is reduced drastically by the end of the first year. For example, in 1956-58 there were 714,445 male children born compared with 675,505 female children, an excess of 38,940 or 5.8 p.c.; during the same period 24,573 male children died during their first year compared with 18,521 female children so that the excess of males at one year of age was reduced to 32,878 or 5 p.c.

As indicated in Tables 1, 2 and 14, infant mortality rates vary considerably from province to province and from one locality to another. One of the principal causes of these variations appears to be the different proportions of births that take place in hospital or under proper prenatal and postnatal care (see also p. 242). Many other factors have also been important, particularly the supervision of water supplies, improved sanitation, the pasteurization of milk, the use of antibiotics, more and better pædiatric services, improved obstetrical and hospital nursing services, improved home environment because of generally higher living standards and, in recent years, the lower age of mothers.

¹ Excludes Newfoundland and the Yukon and Northwest Territories.

Infant Mortality in Urban Centres.—Because of the relatively small numbers of infant deaths in individual cities and towns, the rates for these centres usually vary widely from year to year. As is evident from Table 2, pp. 238-240, many cities and towns have maintained consistently low rates as compared with the national rate or the rate for the province in which they are situated.

Age at Death.—In 1958 the ages of the 14,178 infants who died in their first year of life were by no means evenly spread over the twelve-month span. In fact 12,831 or 90 p.c. of the infants were less than six months old and 9,055 or nearly 64 p.c. were less than one month old. There was a sharp drop to 1,160 in the second month with gradual reductions thereafter to the eleventh month. Of the 9,055 deaths during the first month, 7,658 occurred the first week of life, and no less than 4,437 took place in the first day.

Causes of Infant Deaths.—In 1958 approximately two-thirds of the infant deaths were attributed to five causes. Immaturity was the underlying cause of 2,354 deaths followed closely by congenital malformations with 2,235 fatalities. Deaths from pneumonia in infants of four weeks or over numbered 1,557 in 1958, a significant increase over the 1,460 fatalities from the same cause in 1957. Postnatal asphyxia and atelectasis accounted for 1,508 deaths, and deaths through injury at birth numbered 1,422.

Subsection 3.—Maternal Mortality

As indicated in Table 1, pp. 236-237, the number of mothers who die in pregnancy and childbirth has been greatly reduced during the past two decades. Although the number of births has been much greater in recent years, the number of maternal deaths declined steadily from 1930 (when there were 1,215 deaths and a rate of almost five deaths for every 1,000 births delivered alive) to a record low of 235 in 1957 followed by a slight rise to 249 in 1958. Since 1945 the rate of maternal mortality has dropped below two per 1,000 live births delivered and has been under one per 1,000 live births since 1951. In 1958, however, there was a slight increase in the rate from 0.52 per 1,000 live births to 0.55. Mortality among unmarried mothers is higher than among married mothers.

Age at Death.—Table 16 shows the distribution of maternal deaths by age group and average age at death. The latter is about four years higher than the average age of all mothers at the time of childbirth. The rates per 1,000 live births by age group show that age is a most important factor in maternal mortality. Until very recent years the risk of mortality at childbirth was directly related to the age of the mother; in other words for all mothers of over 20 years the rate rose with increasing age. Though rates for all age groups of mothers have been declining, recently there have been rather significant changes in the rates. Formerly the death rates for mothers in the age group 30-34 was twice or three times as high as the rate for the 20-24 group, but in 1957 and 1958 mortality rates for the four age groups of mothers under 35 years of age were not far apart though after the age of 35 there was a sharp rise.

Causes of Maternal Deaths.—Table 17 shows the main causes of maternal deaths during the years 1956-58. Until a decade or so ago, sepsis and toxæmia were by far the most important causes of death of mothers at childbirth. The danger of death from sepsis and other infection has been drastically reduced over the past 15 to 20 years through the use of antibiotics and probably also through increased use of medical services. On the other hand, the number of deaths caused by toxæmia arising during pregnancy was higher in 1958 than in 1957 and is still a major fatal complication of pregnancy. Hæmorrhage, during pregnancy or delivery, which has been another important cause of mortality among mothers, has shown some reduction in recent years.

Section 4.—Natural Increase*

The rate of natural increase in Canada (excess of births over deaths) prior to 1930 was 13 or more per 1,000 population. Partly as a result of the depression, the birth rate declined more than the death rate and the rate of natural increase fell to 9.7 in 1937. Higher birth rates during and after World War II and a gradually declining death rate caused the natural increase rate to rise steadily from 10.9 in 1939 to a record 20.3 in 1954. Since that time there has been a slight drop but the rate remained as high as 19.7 in 1958—probably the highest among the more industrially developed countries of the world.

Table 18 shows the rates of natural increase in the provinces and for each sex separately. The high rates in the Prairie Provinces are partly accounted for by their relatively younger populations and consequent low death rates. High birth rates and declining death rates, particularly in Quebec, have given Newfoundland, Alberta, Quebec and New Brunswick the highest rates of natural increase in Canada in recent years (excluding the Yukon and Northwest Territories).

The rates of natural increase are higher for females than for males in all provinces because of the higher death rates for males. In the western provinces particularly, the ratio of males to females in the total population is higher than in other parts of Canada and this tends to lower the rate of natural increase. In Canada, a country with a fairly young population and where immigration has been on a large scale, an excess of males is to be expected but the higher rate of natural increase for females may gradually reduce this excess. The trend is towards an eventual excess of females in the total population—as there now is in most European countries—unless immigration again raises the male ratio or death rates among males are drastically reduced.

* For international comparisons, see Section 7, pp. 267-268.

POPULATION

RATE PER 1,000
POPULATION

Natural Increase in Urban Centres.—The classification of births and deaths by place of residence makes it possible to compile the natural increase in the population of urban centres; the figures are presented in Table 2, pp. 238-240.

Section 5.—Marriages and Divorces

Subsection 1.—Marriages*

In 1958 Canada's marriage rate was 7.7 per 1,000 population, the lowest in twenty years. Provincial rates varied from 6.2 per 1,000 population for Prince Edward Island to 8.5 for Alberta but in every province the 1958 rate was below the corresponding rate for 1957. Table 19 shows the number of marriages and the marriage rates per 1,000 population for Canada and the provinces, and percentages of brides and bridegrooms, according to place of birth. For the country as a whole, almost 80 p.c. of the grooms of 1958 were born in Canada and 65 p.c. in the province in which they were married; over 83 p.c. of the brides were born in Canada and 72 p.c. in the province in which they were married. However, as would be expected because of heavy immigration of young persons in the postwar years, an increasing number of marriages are of persons born outside the country. For example, 20.1 p.c. of the grooms married in 1958 were born outside Canada compared with 11.7 p.c. in 1941; for brides the percentages were 16.5 and 8.4 p.c., respectively. However there are wide variations in this pattern as between provinces; in the older Atlantic Provinces and Quebec there is a greater tendency than in the other provinces to marry native Canadians. In these areas both partners in a marriage are often born in the same province.

* For international comparisons, see Section 7, pp. 267-268.

Age and Marital Status of Brides and Bridegrooms.—Table 20 shows that almost 92 p.c. of the marriages in 1958 were between persons who had not been married previously; 4.5 p.c. of both brides and bridegrooms had been widowed, and almost 4 p.c. of the marriages were of divorced persons. The average age at marriage of bachelors was 26 years and that of spinsters 23 years, two and a half months. The average age of widowers and widows at time of remarriage was slightly more than double that of bachelors and spinsters. Over 91 p.c. of the spinsters married in 1958 were under 30 years of age, 33 p.c. were under 20 years and nearly 45 p.c. were between 20 and 25. Over 83 p.c. of the bachelors were under 30 years of age, 7 p.c. of them under 20 and over 48 p.c. from 20 to 24 years of age.

In recent years, couples have been marrying younger than they did a generation ago. Since 1940 the average age of men at the time of their first marriage has dropped from 28 years to 26; that of girls from 24 years and eight months to 23 years and two months.

Religious Denominations of Brides and Bridegrooms.—The distribution of brides and bridegrooms by religious denominations is roughly the same as that for the population as a whole. Table 21 shows the very strong influence that religion has on marriage. About 72 p.c. of all marriages are between persons of the same religious denomination; in 1958 among those of Jewish faith it was about 93 p.c.; among Roman Catholics 88 p.c.; United Church about 62 p.c.; and Eastern Orthodox about 68 p.c.

Subsection 2.—Dissolutions of Marriage (Divorces)

Before World War I the number of divorces granted in Canada was very small. There were fewer than 20 divorces each year from Confederation to 1900, 21 in 1903, 51 in 1909 and 60 in 1913. These numbers represent less than one per 1,000 of the yearly number of marriages. At the end of World War I the number of divorces showed a definite increase, advancing to a peak of 8,199 in 1947, then declining gradually to a postwar low of 5,270 in 1951. From 1952 to 1958 the number has fluctuated between 5,650 and 6,688.

22.—Dissolutions of Marriage (Divorces), by Province, 1931-58

Section 6.—Canadian Life Tables

Four official series of life tables for Canada and the provinces and regions have been published to date, based on deaths in the three-year period around each of the Censuses of 1931, 1941, 1951 and 1956. In addition, tables have been computed for Canada as a whole for the years 1945 and 1947 based on estimated populations by sex and age and the deaths recorded in those years. The life table values for 1956 are given in abbreviated form in Table 23.

Life tables give a summary of the health and general conditions of survival of the population in a conventional, standard form. A hypothetical number (100,000) of births of each sex is assumed as a starting point. The life tables show how, on the basis of the mortality rates at each age in the given years, these 100,000 of each sex are reduced in number by death. For example, during the year 1956, of 100,000 males born, 3,472 died in their first year so that 96,528 survived to one year of age; 241 died in their second year so that 96,287 survived to two years of age, and so on. At 100 years of age only 87 of the original 100,000 would have survived. The probability of death at each age is the ratio between the number of deaths and the population at each age. Finally, the expectation of life is the average number of years which a person might expect to live if the mortality rates in the given years remained constant.

Mortality rates at all ages for males have been almost consistently higher than for females. Males have the highest risk of mortality as compared with females during their first year of life, from their late 'teens to early 30's and from age 50 to 65. For both boys and girls the risk of mortality drops rapidly during childhood and is lowest at about age 10, increases gradually to about age 40 for males and about 50 for females and then rises steeply with advancing age. At the mortality rates given in the 1956 Life Table (see Table 23) about 13,000 males would have died before reaching age 50 as compared with about 8,700 females; only 56,466 of the original group of 100,000 males would have survived to age 70 as compared with about 70,327 females.

By 1956, life expectancy at birth in Canada had reached a new high record of 67.6 years for males and 72.9 for females—comparable to the expectancy for other countries of the world with highly developed programs of medical and public health care. Once a child has passed its first year of life, however, its life expectancy increases appreciably. At one year of age a male child at present mortality risks may, on the average, expect to live an additional 69.0 years and a female 74.0 years, representing for an infant boy a gain of 1.4 years more than his expectation at birth and 1.1 years more for an infant girl. The expectation of life of a 15-year-old boy is 55.9 more years; of a 15-year-old girl 60.6 years. At 25 years of age the expectation is about 46.6 years for men and almost 51 years for women and at age 70, 10.5 years for men and 12.2 years for women.

Table 24 summarizes the life expectancy figures extracted from the Canadian Life Tables for 1931, 1941, 1951 and 1956. Life expectancy at birth increased for men from 60 years in 1931 to over 67.6 in 1956 and for women from 62.1 years to 72.9 during the same period. This is a gain for males of 1.3 years since 1951 compared with gains of 3 and 3.3 years in the previous decades; females gained 2.1 years since 1951 compared with 4.2 and 4.5 years in the preceding decades. Thus, since 1931 a total of 7.6 years has been added to male life expectancy and 10.8 years to female longevity.

The increases in life expectancy have been predominantly at the younger ages, particularly in infancy, and diminish with advanced age. For example, since 1931, 3.2 years have been added to the life expectancy of a five-year-old male, 2.1 years to a 20-year-old, over eight months to a 40-year-old and just over two months to a 60-year-old as compared with 7.6 years for a newborn male. During this period, life expectancy for a five-year-old female gained 7.2 years, for a 20-year-old 6.0 years, for a 40-year-old 3.7 years and for a 60-year-old 2.1 years as compared with 10.8 years for a newborn female.

Longevity has improved for both sexes, though more so and at all ages for females, but there has been only slight improvement for males beyond middle life. Briefly, the rapid decline in the death rate for infants of both sexes is continuing but the declines are slower with advancing age, so that relatively stationary death rates have been established from about 50 years onwards for males and from about 80 for females.

The fact that such a pattern exists is important in interpreting the results of these life tables. The arbitrary population base of 100,000 of each sex in the tables has been subjected to the mortality rates in effect in 1955-57, and the life expectancy computed as if those death rates at each age were to prevail during their lifetime. Actually the theoretical 200,000 infants born in 1955-57 will most probably have a pattern of survival and life expectancy quite different from that of the present life table as they will spend most of their lives under conditions of public health and medical care which in all likelihood will be superior to those prevailing in 1955-57.

The improvement in life expectancy, particularly among children and adolescents, is caused mainly by the substantial reduction in recent years in mortality from infectious diseases; on the other hand, diseases associated with middle and old age are much less amenable to control. It is therefore unlikely that improvement in life expectancy in the future will be comparable to that of the past quarter-century. As approximately 11 p.c. of deaths in 1955-57 occurred among infants and an additional 75 p.c. among persons over age 50, any additional improvement must come as the result of further declines in mortality from conditions associated with childbirth and early infancy, further control of infectious diseases, prevention of accidents, and advances in combating diseases associated with middle and old age, such as cardiovascular-renal conditions and cancer.

Section 7.—International Comparisons of Vital Statistics

Table 25 gives a summary of Canada's national and provincial vital statistics rates along with those of several other countries. It will be noted that among the countries listed the low crude death rate in Canada is bettered by only three countries—Japan, the Netherlands and the Union of Soviet Socialist Republics—and that some of the provinces have lower rates than most other countries. The birth rate also helps to give Canada one of the fastest growing populations, currently ranking sixth among those listed. However, 13 countries reported lower rates of infant mortality.

25.—Principal Vital Statistics Rates of Selected Countries, 1958

NOTE.—Countries are ranked according to the highest rates for births, marriages and natural increase and according to the lowest for deaths.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Canada's health and welfare services have undergone constant development and expansion during the postwar years. Generally high levels of prosperity, strongly growing trends toward urbanization and new advances in welfare and in health concepts and knowledge have all contributed to their rapid growth.

Preventive, diagnostic and curative health and rehabilitation services as well as welfare services have become available to most areas of the country in some degree. The federal-provincial-municipal partnership in health matters, stimulated and co-ordinated through the National Health Grant Program, now forms a flexible and effective bulwark for the medical and allied professions. On the welfare side, the major federal, federal-provincial and provincial income maintenance programs provide basic protection for the individual against the hazards of age, disability, unemployment or other inability to earn and, at the same time, substantially assist the municipality in providing for persons who would at one time have been a local responsibility. Generally well developed systems of hospitals provide facilities in settled areas of the provinces. The federal Indian and Northern Health Service, through hospitals and nursing stations, brings services to the widely scattered and often nomadic population of the North. Cost to the individual as a barrier to obtaining necessary hospital care is being eliminated through the provincial hospital insurance programs developed under the Hospital Insurance and Diagnostic Services Act of 1957 (see p. 272).

* Except where otherwise indicated, this Chapter, including the special article on pp. 281-290, was prepared by the Research and Statistics Division of the Department of National Health and Welfare, Ottawa.

Development in the sciences related to medicine, improved health services and raised nutritional and other standards have contributed to generally favourable health conditions—to a declining death rate and a longer expectation of life. Progress against the contagious diseases emphasizes the problems presented by chronic illness and the disabilities of persons in the older age groups. Heart and hypertensive disease, arthritis and rheumatism are among the leading causes of disability, though residual disability from stroke, Parkinson's disease, epilepsy and multiple sclerosis also accounts for large numbers of disabled persons. The death rate for lung cancer continues to increase and cause controversy, and mental illness remains a major problem. Accidents, especially traffic accidents, constitute a steady and tragic problem particularly as they affect children. Also, Canada now shares the world-wide concern for the hazards of radiation from medical and industrial causes as well as from fallout.

Progress in the welfare field has also been so substantial as to concentrate emphasis on remaining problems, and some of these are of considerable magnitude. Rapid urbanization, increasing numbers of older persons in the population and large-scale immigration are among the forces requiring new social approaches. On the other hand, the growth of the industrial community in Canada has been associated with a marked improvement in the general standard of living. Higher real income has permitted better levels of nutrition and better housing, and improved working conditions and shorter working hours have benefited the industrial worker. During the past decade, urban technical and health services have been extended to the rural population of the country, so that many of the improvements in the national standard of life are being shared more equally by the urban and rural populations.

PART I.—PUBLIC HEALTH

Section 1.—Federal, Provincial and Local Health Services

Provincial governments bear the major responsibility for health services in Canada, with the municipality often assuming considerable authority over matters delegated to it by provincial legislation. The Federal Government has jurisdiction over a number of health matters and all levels of government are aided and supported by the network of voluntary effort that has developed through the years.

Subsection 1.—Federal Health Activities

The Department of National Health and Welfare is the chief federal agency in health matters, but important treatment programs are also administered by the Departments of Veterans Affairs and National Defence. The Dominion Bureau of Statistics is responsible for the collection, analysis and publication of health statistics, the National Research Council and the Defence Research Board administer medical research programs, and the Department of Agriculture has certain health responsibilities connected with food production.

The Department of National Health and Welfare controls food and drugs (including narcotics), operates quarantine and immigration medical services, carries out international health obligations, and provides health services to Indians, Eskimos and other special groups. It serves in an advisory and co-ordinating capacity to the provinces and administers grants to provincial health and national voluntary agencies. Administration of federal aspects of the Hospital Insurance and National Health Grant Program has become a major activity during the past decade.

The Department advises on the visual eligibility of applicants for blindness allowances and co-operates with the provinces in the provision of surgical or remedial treatment for recipients of the allowances. Under the Public Works Health Act, supervision of health conditions is provided for persons employed on federal public works. Other programs of health or medical supervision and counselling are provided to the federal Civil Service, and to the Department of Transport in all matters pertaining to the safety, health and comfort of aircrew and passengers.

Co-ordination with the provinces on health matters is facilitated by the Dominion Council of Health, the principal advisory agency to the Minister of National Health and Welfare. Its membership includes the Deputy Minister of National Health, who acts as chairman, the chief health officer of each province, and five appointees of the Governor in Council representing the universities, labour, agriculture and French- and English-speaking women's organizations. The Council meets semi-annually. Federal-provincial technical advisory committees of the Council deal with specific aspects of public health.

National Health Grant Program.—The National Health Grant Program, inaugurated in 1948, initially made ten federal grants available to the provinces for the development and strengthening of public health and hospital services. Nine are continuing grants: the Hospital Construction, Professional Training, General Public Health, Public Health Research, Mental Health, Tuberculosis Control, Cancer Control, Venereal Disease Control, and Crippled Children Grants. A Health Survey Grant lapsed in 1953 following completion of provincial health surveys. In 1953, after a review of the first five years of the Program, three new grants were established: Child and Maternal Health, Medical Rehabilitation, and Laboratory and Radiological Services.

In 1958, federal assistance under the Hospital Construction Grant was increased to \$2,000 per hospital bed (whether active treatment, chronic, mental or tuberculosis), double the previous grant for active treatment beds. In addition, funds were made available to meet up to one-third of the cost of approved alterations and renovations to existing facilities, with the provinces at least matching federal contributions. There are also matching requirements under the Cancer and Venereal Disease Grants and in the case of services (as distinct from equipment and training of personnel) in those for Medical Rehabilitation and Laboratory and Radiological Services.

Up to Mar. 31, 1959, aid for construction was approved for 77,053 beds, 10,012 bassinets, 15,493 nurses' beds, 330 interns' beds, and space in community health centres and laboratories exceeding 10,650 bed equivalents. Approximately 23,000 health workers had been trained or were undergoing special training and more than 6,200 health workers had been employed with federal grant assistance.

The proportion of the total grants appropriation paid out to the provinces has increased steadily. Payments in 1958-59 totalled \$45,859,381 or 84 p.c. of the amount available; the average utilization during eleven years of the program was 72 p.c.

1.—Amounts Available and Amounts and Percentages Expended under the National Health Program, by Grant, for the Eleven-Year Period Ended Mar. 31, 1959, and for the Year Ended Mar. 31, 1959.

¹ Expenditures may exceed 100 p.c. of amounts available, through transfer of unexpended funds from one grant to another.

In March 1960 the Minister of National Health and Welfare, in testimony before the Special Committee on Estimates of the House of Commons, announced that the amount made available under the General Public Health Grant would be increased by nearly \$5,500,000 and that under the Medical Rehabilitation Grant raised to over \$2,600,000. At the same time he announced that the Laboratory and Radiological Services and Venereal Disease Control Grants would be absorbed into the General Public Health Grant, and the Crippled Children Grant into that for Medical Rehabilitation. The Mental Health Grant would be increased by \$1,500,000 and the grants for Professional Training and Public Health Research to a total of \$1,740,000 each. At the same time the amounts available under the Tuberculosis Control, Cancer Control and Child and Maternal Health Grants would be decreased. This modification of the program was decided upon, after consultation with the provincial health departments and other agencies concerned, because projects formerly dealt with under the Laboratory and Radiological Services Grant are being increasingly included with the hospital insurance schemes and because it was believed that a more effective co-ordination with other local health programs could be achieved if venereal disease problems could be dealt with under the broader terms of reference of the General Public Health Grant. Similarly, it was believed that more flexibility could be given to rehabilitation services under the new arrangement.

Hospital Insurance.—The Hospital Insurance and Diagnostic Services Act of 1957 provides enabling legislation under which federal grants-in-aid are made available to the provinces to assist in operating publicly administered insurance plans for general hospital care. The method of financing and administering plans, as well as the types of service offered above the minimum stipulated in the Act, is a provincial matter.

Under the financial formula, the Federal Government contributes about one-half of the aggregate shareable costs of the hospital insurance plans. In the individual provinces, however, the federal share varies since each participating province receives 25 p.c. of the national per capita cost of hospital services plus 25 p.c. of its own provincial per capita cost, multiplied by the population covered.

The Act enumerates the basic range of services mandatory for any provincial scheme receiving federal support. Each participating province is required to make specified benefits universally available to its population. The total days of care provided may not be limited and must include basic public ward and other in-patient service normally associated with the operation of a hospital, together with certain diagnostic aids for in-patients and, on a permissive basis, for out-patients. Services may be provided in chronic as well as active treatment hospitals, but legislation specifically excludes care in tuberculosis sanatoria, mental hospitals and institutions for custodial care. Capital costs are also specifically excluded from shareable costs. Thus the federal Act is set up to assist in provision of an insurance system for basic general hospital services available under uniform terms and conditions to the entire provincial population. (See also the special article on Hospital Services and Hospital Insurance in Canada, pp. 281-290.)

Food and Drug Control.—The Food and Drugs, Proprietary or Patent Medicine, and Opium and Narcotic Drug Acts govern the safety, purity and quality as well as the labelling and advertising of all foods, drugs, therapeutic devices and cosmetics. Standards of safety and purity are maintained through constant and widespread inspection and laboratory research. In the central Food and Drugs laboratory, standards governing ingredients are formulated and methods of analysis developed. Special research is carried on to establish the safety of new products. Several panels of experts advise on technical and medical problems.

Regulation of the domestic supply of narcotic drugs is maintained through a system of licensed distributors and reports of all stocks subsequently sold or dispensed. Enforcement of the provisions concerning illicit traffic is carried out in collaboration with the Royal Canadian Mounted Police.

Indian and Northern Health Services.—The Department of National Health and Welfare makes available public health, medical and hospital services to about 174,000 Indians and 11,500 Eskimos. The programs relative to Indians and Eskimos are administered by the Directorate of Indian and Northern Health Services in collaboration with the Department of Citizenship and Immigration, and the Department of Northern Affairs and National Resources, respectively.

Services are provided directly to about 2,000 small scattered groups through a network of 17 hospitals, 41 nursing stations and about 80 other health centres staffed by full-time medical officers, graduate nurses, and other health personnel. In areas where departmental staff or facilities are not located, private practitioners and provincial or community health agencies provide care in return for fees for service, payment of per diem rates or through other arrangements. Special emphasis is placed on tuberculosis control through health education, field X-ray surveys, BCG vaccination and early treatment in sanatoria.

Immigrants.—The Department of National Health and Welfare advises on the administration of sections of the Immigration Act dealing with health, and conducts in Canada and other countries the medical examination of applicants for immigration. It also provides care for immigrants who become ill en route to their destination or while awaiting employment. Further assistance in the provision of hospital and medical services is available to indigent immigrants during their first year in Canada, either from the Federal Government or from the province with federal sharing of costs.

As a part of its contribution to World Refugee Year, arrangements were made by Canada for the admission of a number of refugee families with one or more members suffering from tuberculosis.

Quarantine.—Under the authority of the Quarantine Act, all vessels, aircraft and other conveyances together with their crew members and passengers arriving in Canada from foreign countries are inspected by quarantine officers to detect and correct conditions that could lead to the entry and spread of quarantinable diseases in Canada. Fully organized quarantine stations are located at all major seaports and airports.

Under the provisions of the Leprosy Act, modern facilities for the diagnosis and treatment of leprosy are provided at Tracadie, N.B., for the small number of persons in Canada suffering from this disease.

Sick Mariners.—Under the authority of Part V of the Canada Shipping Act, the Department of National Health and Welfare provides prepaid health services for crew members of foreign-going ships arriving in Canada and Canadian coastal vessels in inter-provincial trade; crew members of Canadian fishing and government vessels may participate on an elective basis. Hospital care of crew members resident in any province that has a hospital insurance plan in operation is now the responsibility of the provincial hospital authority concerned. The total number of crew members on vessels paying sick mariners dues in 1958 was about 126,000.

Health Research.—The National Research Council, the Department of National Health and Welfare, the Defence Research Board and the Department of Veterans Affairs all administer grants-in-aid of medical, public health or socio-economic health research. The latter three also conduct intramural research. Federal funds amount to about 50 p.c. of over-all expenditure on medical research in Canada.

The Division of Medical Research of the National Research Council, set up in 1946, offers grants chiefly for fundamental studies in basic medical science. In the year ended Mar. 31, 1960 these totalled about \$1,650,000 with an additional \$300,000 for fellowships and associateships.

The Department of National Health and Welfare supports both intramural and extramural research, chiefly of an applied nature, to an amount of about \$3,500,000 annually. Grant assistance comes from the Public Health Research Grant, with substantial amounts provided from other grants such as those for mental health, cancer

control and general public health. Departmental public health research is conducted in the laboratories of the Food and Drug Directorate, the Laboratory of Hygiene, the Occupational Health Division and the Nutrition Division, as well as by the Epidemiology and Dental Health Divisions. The Research and Statistics Division collects, analyses and evaluates data on health and welfare matters, develops methods to assist in solving technical and administrative problems, and provides research and consultant services to other Divisions of the Department and other agencies in Canada and abroad.

The Defence Research Board carries on intramural research and provides grants-in-aid for investigations related to health problems concerned with national defence.

The Department of Veterans Affairs is concerned primarily with clinical research in its own hospitals, emphasis at the present time being on problems associated with the aging process (see p. 332).

International Health.—Canada has been a signatory to certain international agreements and conventions and is a member of and co-operates with the World Health Organization and other international agencies concerned with health.

To carry out this country's obligations under the International Sanitary Conventions, the Department of National Health and Welfare maintains quarantine measures for ships and aircraft entering Canadian ports and provides accommodation and necessary medical care for persons arriving in Canada who require quarantine.

The Department is responsible for the enforcement of requirements governing the handling and shipping of shellfish under the International Shellfish Agreement between Canada and the United States and, at the request of the International Joint Commission, participates in studies connected with control of pollution of boundary waters between Canada and the United States and with problems caused by atmospheric pollution. Other international health responsibilities include the custody and distribution of biological, vitamin and hormone standards for the World Health Organization, certain duties in connection with the Commission on Narcotic Drugs of the United Nations and the provision of technical assistance to the specialized agencies of the United Nations carrying out programs related to health.

Subsection 2.—Provincial and Local Health Services

Provincial and local health services may be grouped in several broad categories: general public health services, primarily of a preventive nature; services for specific diseases or disabilities combining prevention and treatment; services related to general medical and hospital care; and rehabilitation services for disabled persons.

General Public Health Services.—Provincial and local governments co-operate closely in providing community public health services. The autonomy of the provinces and their social, economic and geographic diversity make for some variety in legislative provisions, in financial arrangements, and in the detailed division of functions between provincial health departments and local and voluntary agencies. Each province, however, offers all or nearly all of a basic range of public health services which includes environmental sanitation, communicable disease control, maternal and child health, occupational health, dental health, health education, nutrition, and public health laboratories.

Environmental Sanitation.—The control of environmental hazards to health, one of the oldest forms of public health activity, is a function of specialized environmental sanitation or public health engineering divisions in each provincial health department. Programs are concerned primarily with the maintenance of safe water supplies, supervision of sewage disposal systems, milk sanitation and control of general sanitary conditions in public areas, the most extensive sanitary facilities being located, of course, in industrial and urban centres. Provincial and municipal sanitary engineers set standards, formulate policies and regulations, and provide technical assistance to local authorities. The intensity of this type of preventive supervision and control varies from province to province and within each province, but basic programs are similar.

Communicable Disease Control.—The control of communicable diseases has been intimately connected with the beginnings and development of public health measures and concepts. Separate divisions of epidemiology or communicable disease control exist in the six larger provinces; in the Atlantic Provinces these functions are handled by a provincial medical health officer. Local health authorities undertake case-finding and diagnostic services in co-operation with public health laboratories, carry out epidemiological investigations and often participate in tuberculosis and venereal disease control measures.

Maternal and Child Health.—Services for mothers and children are largely decentralized through local units and departments, but most provinces maintain separate divisions or employ consultants to promote better standards and to give technical assistance. Public health nurses have a prominent place in this work which may include prenatal education, provision for delivery and care of the newborn in remote areas, home visits, child health clinics and school health services.

Occupational Health.—Services designed to prevent accidents and occupational diseases and to maintain the health of employees are the common concern of provincial health departments, labour departments, workmen's compensation boards, and industry management. Provincial agencies regulate working conditions and offer consultation and educational services to industry. All provinces have on their statute books legislation (Factory Acts, Shop Acts, Mines Acts, Workmen's Compensation Acts) setting health safety standards for employers.

Dental Health.—All provincial health departments have dental health divisions which administer dental programs, varying under local conditions but directed almost entirely to the care of children. Training of dentists in public health, operation of children's preventive and treatment clinics, and health education are being undertaken in all provinces. Water fluoridation projects, involving more than a million people, are in operation in seven provinces.

In four provinces free clinical care is provided for children in remote rural areas by the use of mobile units; another province uses two railway-coach dental clinics to serve remote areas. Locally sponsored plans in which the cost of dental services for children is shared by the local community and the provincial health department are in operation in more than 70 communities in British Columbia; the sponsoring group decides whether registration for treatment is to be free or on the payment of a nominal sum.

Health Education.—In most provinces experience has demonstrated the need for a professional full-time "health educator" as a member of the public health team. Nine provinces have separate divisions or units to co-ordinate the dissemination of health information through all available media.

Nutrition.—Services include technical guidance, education, consultation and research. In some provinces school lunch programs are also sponsored and dietary supplements distributed. Five provinces have special nutrition divisions; elsewhere nutritionists serve in other divisions of the health department.

Public Health Laboratories.—The public health laboratory, an essential facility in the protection of community health and the control of infectious diseases, was one of the earliest provincial services developed to assist local public health departments. Work performed includes bacteriological examination of water, milk and food samples, the examination of specimens for diagnosis of communicable disease and pathological special services. Each province maintains a central public health laboratory and most provinces have established additional branch laboratories. Recent trends in some provinces include efforts to co-ordinate public health and hospital laboratory services, special measures to bring laboratory facilities to rural areas, and devices to reduce the direct cost of clinical laboratory procedures to the individual.

Services for Specific Diseases or Disabilities.—Each province has developed special programs to deal with health problems of particular severity and prevalence, many of which are chronic or long-term in nature. The services and facilities provided to combat such illnesses are generally similar across the country.

Mental Health.—Major developments in provincial mental health programs concern the expanding and modernizing of mental hospitals, the training of various kinds of psychiatric personnel and the extension of community mental health services outside mental institutions. Assistance to patients in securing employment and in social adjustment following discharge from mental hospitals—a relatively new field of rehabilitation—is being promoted by voluntary groups and government agencies in several provinces.

With the exception of the municipally owned local institutions in Nova Scotia and hospitals in Quebec that operate under religious or lay auspices, most mental institutions are administered by provincial authorities. A great part of the cost is borne by the provincial governments, though patients whose relatives can afford to contribute may be charged for care in some provinces. Newfoundland and Saskatchewan provide complete free care; Manitoba assumes a minimum maintenance cost for all patients; in Nova Scotia the provincial hospital gives free care to patients requiring active treatment; and in Ontario and Prince Edward Island mental institution treatment is included in the hospital care insurance plan.

Most public mental institutions provide care and treatment for all types of mental illness; as facilities expand, it is becoming possible to segregate those under intensive treatment from those receiving long-term care. Some provinces maintain separate accommodation for certain categories of the mentally ill. For example, in British Columbia and Alberta, homes for the senile aged are an integral part of the mental institution system. Quebec has separate institutions for epileptics. Seven provinces operate schools for residential treatment and education of mentally defective persons and one of the three other provinces, New Brunswick, enacted legislation in 1958 authorizing the government to support the maintenance of mentally retarded children in approved homes. Increasing numbers of local day classes, usually sponsored by parent organizations, offer training opportunities for mentally deficient children in the community.

As the needs of patients are more fully understood and better methods of treatment develop, the daily routine of the mental patient is becoming less restrictive, as is shown by the increasing number of persons coming voluntarily for treatment. Custodial care and locked doors are giving way to open wards where patients may have unrestricted access to grounds, occupational and recreational areas.

One of the greatest changes in the past decade has been in the extension of community mental health services outside mental institutions. General hospitals have expanded their psychiatric services in both in-patient and out-patient departments. About 30 general hospitals have organized units where psychiatric treatment is provided by professional staffs. Out-patient clinics where mental illness may be treated at an early stage and guidance services given to children and parents also play an important part in the treatment of mental illness outside mental institutions. Fewer than 20 mental health clinics existed in 1948. Groups active in the subsequent large expansion include provincial health departments, municipalities or health units, mental institutions, general and allied special hospitals, school boards and voluntary organizations.

Day and night care centres, another departure from the traditional form of custodial care, developed first in Montreal a decade ago as part of the psychiatric service of two large general hospitals. Similar centres, admitting patients on a nine-to-five basis or in the evening after work, are now conducted at St. John's in Newfoundland, at Toronto and Cobourg in Ontario, and at Burnaby in British Columbia.

Cerebral Palsy.—Cerebral palsied children in most larger cities are able to attend out-patient and training centres, many of which have been organized by parent groups. A number of general and children's hospitals have also established assessment and treatment facilities for cerebral palsied children. Buses to transport children to day centres

and hospital clinics in most communities are provided and operated by local service clubs or provincial crippled children societies. Attendance fees are usually nominal with financial support of the centres coming from local voluntary contributions, provincial governments and federal health grants. Training and employment programs for young adult cerebral palsied persons are also being developed in a few cities.

Tuberculosis.—Despite greatly reduced mortality from tuberculosis and evidence of some lowering in incidence, the number of cases discovered through provincial detection programs indicates that this disease is still a public health problem. Case-finding efforts are being focussed increasingly on selected groups particularly vulnerable to tuberculosis, with diminishing emphasis on mass X-ray surveys and greater attention to tuberculin tests as a means of detecting infected persons. The work of case-finding is supported substantially by voluntary campaigns conducted by the Canadian Tuberculosis Association.

Sanatoria treatment is free in Newfoundland, Nova Scotia, New Brunswick, Manitoba, Saskatchewan and Alberta, and is included in the hospital insurance benefits which came into effect in Ontario and Prince Edward Island. Even in those provinces where a charge for sanatoria care may be made, the amount collected from paying patients is a very small percentage of total costs.

The number of beds set up in sanatoria and in tuberculosis units of general hospitals declined from a peak of 18,977 in 1953 to 14,655 in 1958. This decline in bed use has resulted from such factors as a decrease in the number of admissions, detection of cases in earlier stages of the disease, and improved treatment methods by drugs and surgery. Provision has been made in several provinces to furnish drugs for home treatment. Facilities for the vocational rehabilitation of discharged patients have been developed in all provinces, and increasing numbers are being re-established in suitable employment.

Cancer.—Health departments and lay and professional groups working for the control of cancer have been concerned mainly with four aspects of the problem—diagnosis, treatment, research and public education. In the detection and treatment of cancer, specialized medicine, hospital services and an expanding public health program are closely related. There are programs operating under health departments in four provinces; an equal number have provincially supported cancer agencies or commissions. These sponsor the work of diagnosis and treatment in special clinics located usually within the larger general hospitals. Under the provincial hospital insurance plans, the benefits pertaining to in-patient care in the treatment of cancer are essentially similar in nine provinces and include such special services as diagnostic radiology, laboratory tests and radiotherapy. In at least five provinces these benefits also apply to out-patients. In others, the previous pattern of services to out-patients—that of assessing costs of treatment in relation to ability to pay—is still in effect. Comprehensive free medical programs for cancer patients, which have long operated in Saskatchewan and Alberta, continue unchanged.

Poliomyelitis.—Through agreements with the Federal Government, all provincial health departments have made Salk vaccine available for free inoculation of children and are encouraging older age groups to avail themselves of the protection of this vaccine. During 1959, the incidence of paralytic poliomyelitis rose in all provinces to its highest level since vaccination began, while the national total was the second largest in the previous ten years. By far the greatest proportion of cases occurred among unvaccinated persons. Very few who had received the prescribed number of inoculations contracted the disease.

Previously existing programs offering free standard ward hospital care to poliomyelitis patients have now become incorporated in the federal-provincial hospital insurance schemes. In the provision of restorative services through remedial surgery, physiotherapy and hydrotherapy and the aid of prosthetic appliances, both provincial departments of health and voluntary societies have a part. Post-poliomyelitic patients may receive vocational training under provincial rehabilitation schemes; boards of education operate special classes for physically handicapped children.

Venereal Disease.—Free diagnostic and treatment services are available in all provinces but the operation of government clinics is being increasingly superseded by the method of supplying free drugs to private physicians who are reimbursed for treatment of indigents on a fee-for-service basis.

Alcoholism.—Ontario, Manitoba, Alberta and British Columbia carry out research and education programs and operate centres for treatment, supported largely by public funds. Ontario, Saskatchewan and Alberta also have rehabilitation programs for alcoholic inmates of reform institutions. Recent legislation in Newfoundland and Nova Scotia authorizes the setting up of similar agencies to initiate research and education studies.

Other Diseases or Disabilities.—Services for a number of chronic disabilities, such as heart disease, arthritis, diabetes, visual and auditory impairments and paraplegia, have been developed largely by voluntary agencies, assisted by federal and provincial funds. A brief description of the programs of some of these agencies is given in Part III, which deals with national voluntary health and welfare activities.

General Medical and Hospital Care.—*Public Medical Care.*—Public medical care programs for the general population exist in three provinces, but are limited to residents of particular areas. Approximately one-half of Newfoundland's population receive physician's services at home or in hospital under the provincially administered Cottage Hospital Plan which is financed in part on a premium basis. Medical indigents not under the Plan may also receive care at provincial expense. In addition, all Newfoundland children under the age of 16 years are entitled to free medical and surgical care in hospital. In Manitoba and Saskatchewan, locally operated municipal-doctor programs cover about 30,000 and 167,000 persons, respectively. The Swift Current Health Region in Saskatchewan operates a comprehensive prepaid medical-dental care scheme for about 50,000 persons. These latter programs are subsidized to some extent by provincial health departments.

Nova Scotia, Ontario, Saskatchewan, Alberta and British Columbia provide health service programs for social assistance recipients, although Nova Scotia covers only mothers' allowance recipients and their dependants, and blindness allowance recipients, and in Saskatchewan, old age assistance recipients are the responsibility of the municipality of residence. Manitoba is introducing services. Indigent persons not covered by these programs, as well as indigents in other provinces, may receive necessary care from the municipality of residence. In general, where costs are assumed by the municipality, there is some form of cost-sharing arrangement with the provincial government.

Under the Ontario program, the major medical services offered are physician's care in the home and office, including certain minor surgical procedures and prenatal and post-natal care. Since Jan. 1, 1959, basic dental care has been available to the children of mothers' allowance recipients. In addition to these medical services, Nova Scotia provides major and minor surgical and obstetrical services and medical attendance in hospital. The programs in Saskatchewan, Alberta and British Columbia give complete medical care in the home, office and hospital, including surgical and obstetrical services, specified prescription drugs (except in Alberta, and with a dollar limitation in Saskatchewan) and dental and optical care, sometimes only on authorization and/or with dollar limits. All of these plans are completely provincially financed, except in British Columbia where costs are shared on a 90-10 basis with the municipalities assuming their share on a proportionate population basis, and in Ontario where per capita contributions towards the cost of medical services for the assistance group are shared on an 80-20 basis with the municipality of residence.

Hospital Care.—The four provinces with hospital insurance plans in operation prior to the passing of the federal Hospital Insurance and Diagnostic Services Act of 1957—Newfoundland, Saskatchewan, Alberta and British Columbia—amended their programs to bring them into conformity with the federal Act from July 1, 1958. Manitoba commenced its plan on the same date. The Nova Scotia and Ontario plans became operative

on Jan. 1, 1959, that of New Brunswick on July 1, 1959 and of Prince Edward Island on Oct. 1, 1959. An agreement was signed with the Northwest Territories in March 1960, to become effective Apr. 1, 1960.

All plans, in conformity with the federal Act, provide in-patient services to all insured residents of the province under uniform terms and conditions. The Act also permits federal sharing in the costs of certain out-patient services; the extent of participation in such services varies from province to province. (See also p. 272 and the special article on Hospital Services and Hospital Insurance in Canada, pp. 281-290.)

Rehabilitation Services.—Expansion of rehabilitation services in all provinces indicates growing success in prevention and control of many disabling conditions, and broader understanding of the needs of handicapped persons. Following the earlier rehabilitation programs organized for injured workers, disabled war veterans and such groups as the blind and the tuberculous, there has been continued progress in the development of services for other disability groups and special medical, vocational, educational and social services for the handicapped. More emphasis is being given to extending comprehensive services to all handicapped, regardless of disability, and to strengthening national, provincial and community bodies concerned with planning and co-ordination. The broadening scope of rehabilitation programs and the movement toward integration of the numerous specialized services are exemplified by the liaison developed between two of the large national voluntary agencies, the Canadian Council for Crippled Children and Adults and the Canadian Foundation for Poliomyelitis and Rehabilitation, as well as by the steady growth of the official provincial rehabilitation programs and the development of co-ordinated community services for the handicapped. Concurrently there has been more attention given to improving treatment and social services for mentally ill persons, mentally retarded children, alcoholics, cerebral palsied children and other disability groups.

Rehabilitation services for persons handicapped by physical or mental defects are organized under voluntary and public auspices as part of general health, welfare or education programs, and also by specialized agencies that provide one or more rehabilitation services. In many of the larger cities, these facilities include hospital physical medicine and rehabilitation departments and special clinics for particular disabilities, separate rehabilitation centres, sheltered workshops, vocational counselling, training and job-placement agencies, and special classes, schools and other combined treatment and education centres for handicapped children. Home care services such as nursing, physical and occupational therapy and housekeeping services, employment of the homebound and recreational services have been started by a few agencies, but their coverage is generally limited.

The main elements of the nation-wide rehabilitation program, introduced in 1953, are supported by joint federal-provincial programs for the co-ordination of rehabilitation services, the vocational training of disabled persons, and the National Health Grants designated for the extension of medical rehabilitation and crippled children's services and for the rehabilitation of the mentally ill or deficient, the tuberculous and other chronically ill. Vocational assessment and counselling of the handicapped is provided by rehabilitation officers attached to the provincial rehabilitation services and by some of the other rehabilitation agencies and centres. Medical rehabilitation services are made available through the provincial public assistance medical care schemes, hospital insurance plans, public health services, the voluntary agencies and various Health Grant projects. The main responsibility for job placement of persons with occupational handicaps is carried by about 140 special placement officers located in the larger National Employment Service offices across the country, although some rehabilitation agencies also do placement work, especially of the severely handicapped. The Federal Government also provides direct services through the programs administered by the Department of Veterans Affairs which operates special centres for the treatment of chronically ill and aging veterans, by the

Department of Citizenship and Immigration for physically and socially handicapped Indians, and by the Department of Northern Affairs and National Resources for the resettlement of Eskimos suffering from disability.

In the year ended Mar. 31, 1959, federal-provincial expenditures, shared under the Co-ordination of Rehabilitation of Disabled Persons Agreements administered by the Department of Labour, increased to \$195,000. The cost of support of 1,174 disabled persons reported as rehabilitated was \$1,232,000 during the year prior to acceptance as compared with estimated annual earnings of \$2,219,300 after placement in jobs. The total vocational training expenditures under the Special Vocational Training Projects Agreements, also a matching grant administered by the Department of Labour, increased to \$533,000 for the training of 1,251 individuals enrolled in a wide range of vocational courses. The number of special placements of handicapped persons who required assistance in finding work decreased to 14,845.

Expenditures on projects under the Medical Rehabilitation Grant and Crippled Children Grant (a portion of these funds being on a matching basis) amounted to \$1,104,840 of the \$1,500,000 available from federal funds in the year ended Mar. 31, 1959. Through the 75 projects approved under these grants, equipment was provided for 35 hospitals and rehabilitation centres, and support was given for the extension of services by 12 rehabilitation centres, 10 hospital centres and clinics, 17 cerebral palsy training centres, six crippled children's services, and by seven of the provincial programs. Other projects supported the full-time professional training of 47 rehabilitation personnel with additional bursaries for short courses, and also the operation of three university schools of physical, occupational and speech therapy.

Subsection 3.—Health Services in the Yukon and Northwest Territories

Health services in the two Territories are operated under conditions considerably different from those in the provinces. Extensive sparsely settled areas, climatic conditions, lack of local government and direct federal administration constitute a basic set of conditions under which health services for both native and white populations, outside the few settled areas, are provided by government agencies or religious organizations. The Yukon Territorial Government, the Northwest Territories Council, the Directorate of Indian and Northern Health Services of the Department of National Health and Welfare, the Department of Northern Affairs and National Resources and the Department of National Defence are all concerned with the provision of services.

Complete health services are supplied to Indians and Eskimos by Indian and Northern Health Services. Particular emphasis is given to tuberculosis, and mass X-ray programs are carried out annually. The Eastern Arctic is served by the annual Eastern Arctic Patrol as well as by medical health officers. In the Western Arctic, medical officers and nursing stations are located at strategic points and a travelling dentist is employed. Persons who cannot be cared for locally are transferred to federal hospitals in the provinces.

In the Yukon Territory, services for the white population are administered through the Commissioner for the Yukon and include complete treatment for tuberculosis and poliomyelitis patients and hospital care for indigent residents. Public health services include communicable disease control, public health nursing, sanitary inspection and tuberculosis case-finding.

The Northwest Territories in March 1960 concluded an agreement with the Federal Government concerning hospital insurance to become effective on Apr. 1, 1960. Health programs for the white population include treatment for tuberculosis and venereal disease as well as dental care for children under 17 years of age and hospital care for the mentally ill. Cancer diagnosis is provided through the Edmonton Clinic. Indigent residents are eligible for medical, dental and optical services as well as for general hospital care.

HOSPITAL SERVICES AND HOSPITAL INSURANCE IN CANADA

The Hospital Insurance and Diagnostic Services Act of 1957 was a notable advance in the development of Canada's social security system. It signified the willingness of the Federal Government to enter into a co-operative program with the provinces to make hospital care available on a prepayment basis to the whole population.

The new legislation has been helpful in many ways. From the viewpoint of the individual sick person it meant prepayment of the bulk of the cost of his hospitalized illness. To the individual hospital it provided a guarantee of stable income and continuing financial support, thus permitting hospital authorities to concentrate more completely on improvement of patient care. To provincial governments it represented a federal undertaking to share the costs of provincially administered hospital insurance schemes.

Hospital Trends

Federal-provincial hospital insurance arrangements are the culmination of a long series of efforts to find a solution to the increasingly complex problems involved in financing hospital care. Rapidly rising operating expenditures and capital costs have in large part resulted from quantitative expansion and qualitative improvement in hospital services and facilities. Medical progress has multiplied the number of services necessary for skilled diagnosis and treatment, has increased the dependence of the physician and the patient on the hospital to provide these services, and has stimulated public demand for more service as well as for a higher level of service.

Utilization.—In 1958, general and allied special hospitals* admitted about 2,500,000 adults and children, recorded 420,000 newborn infants, and provided 31,400,000 days of care to adults, children and the newborn, compared with 20,000,000 days of care only ten years before. In terms of population, the days of care provided to adults and children per thousand persons increased from 1,371 days to an estimated 1,684 days over the ten-year period. As the average length of stay in hospital remained nearly constant at about ten days per patient during this time, it is clear that the increased volume of care per thousand population was caused by an increase in the rate of admission to hospital. Estimated admissions per thousand population increased from 115 in 1948 to 147 in 1958. Taking multiple admissions of the same patient into consideration, it has been estimated that about one of every nine persons was admitted at least once in 1958, compared with one of 12 persons only ten years earlier.

Beds.—A very considerable increase in hospital bed capacity was necessary to make possible the higher volume of care now being provided. From 1948 to 1958, acute treatment rated bed capacity increased by more than 50 p.c. from about 54,000 to 82,000 beds, while the bed-population ratio moved up from 4.2 to 4.8 rated beds per thousand population. The estimated number of chronic-convalescent beds* available more than doubled from 6,700 to 15,000 beds at the end of 1958. The federal Hospital Construction Grant introduced in 1948 has played a major role in stimulating hospital construction, with nearly 50,000 active treatment beds, 8,000 chronic beds, and many other types of beds and special facilities built or under construction by the end of the year 1959. The rapid modernization of Canada's hospital plant is illustrated by the fact that about 45 p.c. of existing bed capacity in general and allied special hospitals has been built during the past ten or eleven years. Nevertheless, even though the over-all ratio had reached 5.7 beds per thousand population at the end of 1958, rapid population growth constantly threatens to outstrip bed expansion in a number of provinces.

Personnel.—The growth of hospital personnel in the postwar "full employment" period has been remarkable in view of the strong competition from other forms of employment. Since 1948, hospital employees in all types of hospitals increased by 88 p.c., from 95,000 to 180,000 in 1958. Hospital employees represented about 2 p.c. of the total civilian labour force in 1948, 2.5 p.c. in 1953, and 3.0 p.c. in 1958. Factors affecting the increase

* Exclusive of mental hospitals, tuberculosis sanatoria and federal hospitals.

of hospital personnel include increases in hospital plant and beds and the volume of patients under care, a progressive reduction of the hospital work-week, and technological changes that have increased the quantity of service rendered to each patient per patient day. Professional and technical personnel to operate the various special services such as clinical laboratories, radiology, electrocardiography, physiotherapy, and so on, have become increasingly significant and essential; even in the nursing group the average number of graduate nurses per hundred patients under care daily rose from 28 to 38 in the period between 1948 and 1958.

Cost of Hospital Care

Both the volume of service rendered (as measured by days of care) and the physical plant (as measured by beds) of general and allied special hospitals have increased by slightly more than 50 p.c. between the years 1948 and 1958. By contrast, annual net operating and capital expenditures have risen by more than 200 p.c. since 1948.

Operating Expenditures.—In 1958, non-federal general and allied special hospitals (exclusive of private hospitals) expended approximately \$450,000,000 on current operations, a ten-year increase of 246 p.c. Over this period, the national average cost per patient day for adults and children increased from \$7.62 to \$17.24, and the national average per capita cost from \$10.19 to \$26.51.

The rise in total operating costs since 1948 may be viewed as the composite result of a number of factors which can be summed up in four groups: economic inflation, total population increase, increased utilization of hospitals per unit of population, and increased quality and quantity of service per patient day. The relative influence of each factor may be gauged by recalculating the 1958 estimated expenditures as if the value of the dollar, total population, and the rate of hospital utilization by that population had remained unchanged throughout the period of comparison. On this basis it has been estimated that general price inflation was responsible for more than two-fifths of the aggregate increase, population growth for about one-quarter, 'internal' factors intrinsic to hospital operation for one-quarter, and increasing utilization rates (days of care per thousand population) for about one-fifteenth.

With regard to 'internal' factors in hospital operation, the greatly increased number of hospital personnel required has tended to make salary levels rise more rapidly than average industrial wages and salaries, thus reducing a long-standing lag. The payroll component of operating expenditures in general and allied special hospitals rose from 48 p.c. of total payrolls in 1948 to 61 p.c. in 1958.

Capital Costs and Construction Grants.—Hospitals represent a major investment in land, buildings and equipment and form an important segment of Canada's 'social' capital; total valuation is broadly estimated as in excess of \$1,500,000,000. Annual construction expenditures reached an estimated \$125,000,000 in the year 1958. For active treatment beds, the estimated average cost per active treatment bed under construction or completed during the year ended Mar. 31, 1959 was \$19,600, approximately double the average cost of construction per bed ten years earlier. Inflation, of course, has been a major factor in the higher costs of construction but the changing nature of the facilities being constructed has also been significant. Whereas ten years ago emphasis was placed on development of small hospitals (relatively low in cost) in rural areas, efforts in recent years have been focussed on the enlargement of existing institutions in urban areas and the development of highly specialized facilities as well as on increasing the number of patient beds.

For capital funds, voluntary hospitals have in the past depended primarily on the benevolence of private groups and individuals, municipal hospitals have been dependent on local taxes, while provincial and federal funds were allocated originally in large part to construction of certain special hospitals operated by these governments. The growing necessity of stimulating and controlling construction of facilities in accordance with social needs led several provinces to introduce capital grants, beginning with Saskatchewan in

1944. These were followed by the federal Hospital Construction Grant in 1948 and its expansion in 1958. The development of provincial hospital insurance schemes has brought about further provincial assistance in some provinces towards capital, interest and depreciation costs.

The federal Hospital Construction Grant Program was launched in 1948 with an allocation of \$13,000,000 a year for project grants to be distributed among the provinces on a population basis. In the fiscal year 1959-60, following several changes through the years, a total of \$25,781,000 was available, including \$17,367,000 as the annual allocation for new construction, plus \$8,413,000 re-voted for projects begun but not completed in previous years. Under a revised program, effective since 1958, the Federal Government may contribute up to \$2,000 for each approved active treatment, chronic-convalescent, mental or tuberculosis bed, every three new bassinets, and for each 300 sq. feet of interior floor space of a community health centre or hospital training facilities. Further payments of \$750 a bed are available for the construction of nurses' residence beds, and for interns' quarters in hospitals. Assistance is provided also for major renovation or alterations to existing facilities. In each instance, the federal grant may not exceed one-third of the total cost of the construction project, and in all cases the province is required to at least match the federal grant.

Development of Hospital Insurance

Until very recent years, the bulk of hospital revenues to meet operating costs was derived from direct payments by patients and their families at the time of hospitalized illness. As costs began to increase (with corresponding increases in difficulty of payment by patients and collections by hospitals) voluntary and commercial organizations established prepayment plans providing for payment from pooled funds set up through regular contributions by participants. These methods helped to lift the financial burden from the insured patient and to stabilize hospital revenues but, despite tremendous growth, failed to protect substantial elements of the population and to fully meet hospital needs during a period of rapidly rising costs.

Maintenance Grants.—Government financial assistance towards hospital operating costs dates from the nineteenth century when local governments were responsible for indigent care under the "Poor Law" tradition. Provincial governments became involved initially on behalf of indigents resident in municipally unorganized territory, and in cases of prolonged illnesses such as mental illness and tuberculosis for which relatively few persons could pay full costs over a long period. In time, various provincial governments began to subsidize hospital care for other specific diseases, to assist directly in paying the costs of care for various indigent groups, and to provide regular maintenance grants to hospitals.

Municipal Prepayment Plans.—Tax-supported hospital insurance schemes began in Canada as a device to supply hospital services in certain sparsely populated rural areas. As far back as 1916 in Saskatchewan and 1919 in Alberta, provincial legislation authorized the formation of inter-municipal hospital districts for the construction and operation of local hospitals; some municipalities commenced immediately to prepay hospital care for resident ratepayers and their dependants, through funds derived from property taxes. Eventually, a number of districts permitted voluntary participation by non-ratepayers through payment of a personal tax for the purchase of "hospital service tickets". By 1946 these local plans served substantial segments of the rural population of Alberta and Saskatchewan.

Newfoundland.—Until the middle 1930's Newfoundland was almost totally lacking hospital services for a large proportion of the island's dispersed population. In 1934, the Cottage Hospital Plan, a combined program of hospital construction and prepaid medical and hospital care, was commenced for outlying areas. Under the Plan, prepayment of

small annual fees by subscribers in cottage hospital districts entitled beneficiaries to out-patient diagnosis and treatment, home visits by the doctor and public ward care in the local hospital or the St. John's General Hospital; residual costs of the government-operated hospitals were met from general tax revenues. By 1958, about one-third of the province's population was covered for a comprehensive range of health services, and about one-half for hospital care under the Cottage Hospital Plan. In addition, the provincial government supplied free medical and hospital care for indigent persons throughout the province, and in 1957 introduced a program of out-patient diagnostic services and public ward hospital care for children under 16 years of age. In 1958, medical and surgical care in hospital was added to the children's program.

Saskatchewan.—Interest in the development of publicly financed province-wide hospital insurance schemes, indicated in the 1930's by health insurance legislation enacted (but not put into effect) by Alberta in 1935 and British Columbia in 1936, was renewed in the early postwar period. Saskatchewan became the first province to adopt a universal coverage hospital care prepayment plan. Under the Saskatchewan Hospitalization Act, enacted in 1946 and implemented on Jan. 1, 1947, municipal plans were replaced by a province-wide scheme financed partly through compulsory personal premiums collected by arrangement with the municipalities, partly through one-third of the proceeds of a 3-p.c. provincial sales tax, and partly from provincial general revenues.

British Columbia.—British Columbia followed Saskatchewan in 1949 with the development of a universal coverage prepayment program financed through premiums collected primarily through a payroll deduction system with rates designed to pay nearly the full cost of the program. Co-insurance charges, payable by the patient at the time of service, were introduced in 1951. Factors such as collection difficulties and the high mobility of the labour force brought about the abolition of premiums in 1954. Provision was made for financing from general revenues, and for this purpose the provincial retail sales tax was increased from 3 p.c. to 5 p.c.

Alberta.—Provincial action in Alberta was more gradual and evolved directly from experience with municipally operated programs. Assistance to municipalities was preceded by several special programs such as hospital care for poliomyelitis patients in 1938, hospital care for cancer diagnosis in 1943, free public ward care for maternity patients in 1944, and a provincial program of health services for selected categories of public assistance recipients in 1947. The province introduced grants-in-aid of municipal prepayment plans for public ward care in 1950; three years later the grants were extended to include 'extra' or special services. By 1957, municipal prepayment districts encompassed approximately 75 p.c. of the population of the province. This scheme provided for a three-way division of costs among the patient, the municipality and the provincial health department. The patient was charged \$1 a day for public ward care and up to \$1 a day for special services, with residual costs shared by the municipality through a compulsory levy on real property and by the province which paid 50 or 60 p.c. of the remainder, as well as statutory grants to hospitals and payments under the special provincial programs. Alberta introduced a new system of province-wide coverage on Apr. 1, 1958.

Recent Developments.—Federal hospital insurance legislation stimulated the further development of provincial hospital insurance schemes. British Columbia, Alberta, Saskatchewan, Manitoba (with a completely new scheme) and Newfoundland (with new province-wide coverage), entered the federal-provincial cost-sharing arrangements on July 1, 1958. Ontario and Nova Scotia commenced provincial hospital insurance schemes on Jan. 1, 1959, New Brunswick on July 1, 1959 and Prince Edward Island on Oct. 1, 1959. It is anticipated that programs in the Northwest Territories and the Yukon will begin sometime during 1960, and Quebec has indicated that steps are under way to implement a program in that province.

Federal Legislation and Provincial Programs

Efforts directed toward the development of a nation-wide plan for hospital insurance have been based on the grant-in-aid approach, rather than on a federally administered program involving an amendment to the British North America Act. The first federal move was made in 1942 when a special inquiry committee to study health insurance was established. After preparing an exhaustive report and drafting legislation, the committee presented its report to Parliament. In 1945 the Federal Government presented the first concrete proposals for a comprehensive nation-wide health insurance program to the Federal-Provincial Post-War Conference on Reconstruction, to be introduced in stages as an integral part of a broader proposal for federal-provincial co-operation. The proposals included (a) general practitioner services, hospital care and visiting nursing services, as a first stage; and (b) other services, including specialist services, laboratory and radiological services, dental care, drugs, etc., at successive later stages. They also included an offer to make available to the provinces a number of grants to strengthen and expand health services. When the conference failed to reach agreement on broader fiscal proposals, the health proposals were not pursued further at that time.

In 1948, the Federal Government established a system of national health grants, which included a grant for hospital construction. Other grants, some of which gave assistance to hospital services, were for health surveys, professional training, public health research, general public health, mental health, tuberculosis control, cancer control, crippled children and venereal disease control. In 1953, grants for child and maternal health, laboratory and radiological services and medical rehabilitation were added. In introducing this program in the House of Commons, the Prime Minister described the grants as "being fundamental prerequisites of a nation-wide system of health insurance".

At the Federal-Provincial Conference of 1955, a request that consideration of health insurance be included on the agenda came from some of the provinces. Early in 1956, the Prime Minister offered a federal program of technical support and financial assistance to provincially administered programs covering hospital care and diagnostic services. Under the terms of the Hospital Insurance and Diagnostic Services Act of 1957, implementation of federal assistance was authorized as soon as a majority of the ten provinces, containing a majority of the population of Canada, had agreed to participate. In the following year, the Act was amended to delete the limiting provision for commencement, so that the five provinces that were prepared to begin could participate in the joint program starting on July 1, 1958. Since then, as already mentioned, four additional provinces have inaugurated programs and joined the federal-provincial arrangements.

Basic Features.—The federal-provincial hospital insurance program is essentially a cost-sharing arrangement designed to provide an orderly prepayment method of meeting the basic costs of care in general and allied special hospitals for all residents of the country.

In order to participate in the program, a province is required to make insured services available to all residents of the province under uniform terms and conditions. Insured services must include specified in-patient services including diagnostic services and, on an optional basis, may include hospital out-patient services. The provinces must undertake to maintain adequate standards of hospital care, to make payments to hospitals on a clearly defined basis, and to maintain adequate records and accounts. In general, however, although the basic content of the program is defined in the federal Act and Regulations, each province decides the form of its own program, including such important aspects as methods of financing the provincial share of costs, details of eligibility for benefits, inclusion of "deterrent" authorized charges to the patient, the pattern of provincial administration, and inclusion of additional benefits and payment of costs not shared by the Federal Government. To provide assurance that provincial arrangements are adequate for control of quality of care and utilization, and for financial control, each participating province must submit a detailed scheme of administration for federal approval as part of the federal-provincial agreement. The agreements are the instruments through which contractual arrangements are made for the payment of federal contributions.

Under federal legislation and regulations, and the contractual agreements, federal financial assistance is given towards the shareable costs of insured in-patient and out-patient services. Excluded from shareable costs are the costs of care for patients in tuberculosis sanatoria, mental hospitals and custodial institutions such as homes for the aged, and capital costs including interest on debt and depreciation allowances. Revenues from services provided to uninsured persons and to insured persons otherwise covered by legislation such as provincial workmen's compensation laws, deterrent 'co-insurance' charges, and a number of other items are deducted. In addition, the Federal Government does not share the costs of provincial administration of hospital insurance.

The total available amount of the federal contribution towards shareable costs is a direct function of actual operating costs in general and allied special hospitals, which makes it an 'open-end' grant without any ceiling. When all provinces are participating, the aggregate federal amount available for all provinces and territories will represent 50 p.c. of the national shareable cost of insured in-patient services made up of shareable costs in ten provinces and two territories, but the actual percentages payable in each participating province will vary from one province to another. Under the formula laid down by the Act, the annual federal contribution for any participating province is the aggregate for that year of 25 p.c. of the national per capita shareable cost of in-patient services (actual costs in participating provinces plus estimated costs in non-participating provinces), plus 25 p.c. of the per capita shareable cost in the province (costs of insured services less deductions for authorized charges to patients), multiplied by the average covered population in the province throughout the year. If a province elects to provide a range of out-patient services, an additional federal contribution is made towards the cost of these services in the same proportion as for in-patient services. Under this method, the Federal Government provides higher per capita assistance to provinces where costs are higher than the national average, but pays more than 50 p.c. of provincial costs to provinces where costs are lower than the national average. Thus, for the year 1959, preliminary estimates indicate that the federal share may vary from 43 p.c. to 62 p.c. of shareable costs because of differences from province to province in the per capita cost of care.

Further federal assistance is available through the National Health Grant Program as well as through the technical and consultant services provided by the Department of National Health and Welfare. In addition to the Hospital Construction Grant for capital development, and the Tuberculosis Control and Mental Health Grants which support projects for expansion of services in these areas, other health grants may be used for hospital research projects, professional training of hospital personnel, and the establishment of provincial technical and consultant services to assist hospitals. These additional sources of assistance reflect the view that attention should be directed toward improving the quality of hospital care.

Methods of Financing.—Hospital insurance distributes the cost of insured services over practically all income earners. With regard to the federal share of the cost, this is accomplished through general revenue financing and the existing federal tax structure. The method by which a provincial hospital insurance plan raises the money to finance its share is entirely a provincial matter, and the diversity of local conditions has called for a variety of arrangements ranging from complete general revenue financing to a complete contributory system.

Four provinces—Newfoundland, Nova Scotia, Alberta and British Columbia—finance their programs in a variety of ways through the general tax system. Nova Scotia has a 3-p.c. hospital tax which is levied as a general sales tax on retail purchases to assist in the financing of the program. British Columbia finances its program mainly from general revenues, with some costs being met by co-insurance charges made by patients at the time of hospitalization. In Alberta, some funds are obtained from municipal tax revenues (3½ mills in 1959) and some from co-insurance charges, but the bulk of the revenue is provided from provincial general revenues. Newfoundland finances its hospital services plan entirely from general revenues.

Five provinces—Saskatchewan, Manitoba, Ontario, New Brunswick and Prince Edward Island—have introduced contributory personal premiums with a multi-rate structure for single persons and families as the principal method of financing the provincial share of hospital insurance costs. Annual premium rates in the year 1959 (or for some provinces beginning in 1960) for single persons were: Saskatchewan, \$17.50; Manitoba, \$24.60; Ontario and New Brunswick, \$25.20; and Prince Edward Island, \$24. For families the rates were: Saskatchewan, family maximum of \$35; Manitoba, \$49.20; Ontario and New Brunswick, \$50.40; and Prince Edward Island, \$48. Premiums are collected through a combination of compulsory payroll deduction and compulsory collection by municipalities in Manitoba and New Brunswick; through compulsory payroll deduction plus voluntary enrolment in Ontario and Prince Edward Island; and through compulsory payments to municipal or provincial offices in Saskatchewan. General provincial revenues are used to supplement this revenue to the extent necessary.

Population Coverage and Eligibility.—The estimated total population coverage in nine participating provinces at the end of the year 1959 was 11,900,000 persons, or about 95 p.c. of the combined population of these provinces. In accordance with the terms of the federal Act, insured services in each participating province must be uniformly available to all residents of the province. The basic objective is universal coverage, but conditions of eligibility for benefits vary from one province to another.

In Newfoundland, Nova Scotia, Alberta and British Columbia, where the programs are financed in a variety of ways through the general tax system, residence in the province is the determining factor in eligibility. All residents of these provinces, apart from a few persons covered under other specified federal or provincial programs, are entitled automatically to hospital insurance coverage. Entitlement is immediate without any waiting period in Alberta and Newfoundland; in British Columbia and Nova Scotia automatic entitlement follows completion of three consecutive months permanent residence in the province. No distinction exists between indigents, public assistance recipients and other beneficiaries in these provinces. Coverage is automatic, compulsory and universal.

In Saskatchewan, Manitoba, Ontario, New Brunswick and Prince Edward Island, eligibility for benefits is dependent upon payment of a premium as well as upon residence requirements. Participation through payment of premiums is compulsory for all residents able to pay in Saskatchewan, Manitoba and New Brunswick. In Ontario and Prince Edward Island, participation is compulsory for residents employed by firms with 15 or more employees, and three or more employees, respectively; enrolment of other residents is on a voluntary basis. The waiting period for benefits following establishment of permanent residence in the province is three months in Saskatchewan, Ontario, New Brunswick and Prince Edward Island, and one month in Manitoba.

In the five premium-paying provinces, special provision exists to extend coverage to indigents and public assistance recipients. In Saskatchewan, Ontario and Prince Edward Island, the provincial government pays premiums on behalf of recipients of provincial public assistance and their dependants; in Manitoba and New Brunswick the specified classes of provincial public assistance recipients are covered automatically without premium payments on their behalf. In most cases, the municipalities are responsible for the payment of premiums on behalf of local relief recipients and other indigent residents not receiving provincial public assistance, or alternatively for payment of per diem rates established by the provincial authority where coverage is not provided. The Federal Government pays premiums on behalf of indigent Indians and of war veterans allowance recipients and their dependants.

In addition to persons voluntarily excluded in Ontario and Prince Edward Island, other persons excluded from the schemes in all provinces include inmates of federal penitentiaries, members of the Armed Forces and the Royal Canadian Mounted Police, transients, visitors and other persons lacking residence qualifications.

Benefits.—Basic in-patient benefits are similar in each of the provinces. They include accommodation and meals at the standard ward level, necessary nursing service, laboratory, radiological and other diagnostic procedures together with the necessary interpretations, specified drugs and biologicals where administered in hospital, use of operating room, case room and anaesthetic facilities including necessary equipment and supplies, routine surgical supplies, use of radiotherapy and physiotherapy facilities, and services rendered by personnel employed by the hospital except for certain services provided by physicians. Benefits do not include the services of doctors or nurses not employed by hospitals, extra charges for private and semi-private accommodation, or drugs excluded by the provincial authority.

Out-patient hospital benefits, allowable on an optional basis under federal legislation as a means of reducing in-patient admissions for diagnostic purposes, have been adopted in widely varying degree by provincial hospital insurance schemes. Only the four Atlantic Provinces provide comprehensive benefits involving laboratory and radiological diagnostic procedures and interpretations (all types in Newfoundland and specified types in Nova Scotia, New Brunswick and Prince Edward Island); use of radiotherapy and physiotherapy facilities (except for exclusion of radiotherapy facilities in New Brunswick); emergency out-patient care including staff services, use of facilities and drugs (except in Newfoundland); and, generally, designated services rendered by persons receiving remuneration from the hospital. Elsewhere, diagnostic services other than those required for emergency out-patient care are excluded, with the exception of tissue pathological examinations, provincial laboratory tests and cancer clinic services in Saskatchewan, and diagnosis for minor surgical procedures in Manitoba and Saskatchewan. Emergency out-patient care following an accident is a benefit in British Columbia, Saskatchewan, Manitoba and Ontario; Manitoba and Saskatchewan also include out-patient services for minor surgical procedures, and Manitoba includes electro-shock therapy. Alberta is the only province without any out-patient benefits generally available, although for the specific group of provincial public assistance recipients it provides the most comprehensive range of out-patient benefits in Canada as part of the provincial hospital insurance scheme.*

Benefits for care provided in out-of-province hospitals also vary between provinces. In most instances they are available only for persons retaining coverage who have moved to another province, or for emergency care of residents temporarily absent from the home province; some provincial schemes permit referrals to out-of-province hospitals for special care that cannot be provided in their own. Most of them place a limit on the length of stay allowed in out-of-province hospitals.

No other specific limit is placed on the duration of hospital care. The criterion applied is the opinion of the attending physician as to whether continued hospital care is a medical necessity. From the outset in most provinces, benefits have applied to both acute and chronic conditions requiring hospitalization. All schemes require regular reports on each patient to substantiate that admission is medically necessary.

Participating Hospitals.—The federal Act provides for inclusion of acute and chronic care hospitals and other 'special facilities' rendering insured services, but specifically excludes mental hospitals, tuberculosis sanatoria and custodial facilities from the federally shared program. For an institution to qualify as a participating hospital, it must be licensed, approved or designated by the provincial hospital insurance authority and listed in an appendix to the federal-provincial agreement. Generally, all public general hospitals have been approved for inclusion in the hospital insurance system, but variations among provinces exist with regard to certain classes of special hospitals, chronic hospitals, private hospitals and nursing homes.

Ontario and Prince Edward Island are the only provinces to include tuberculosis sanatoria and mental hospitals in the provincial hospital insurance scheme; in other provinces separate provisions cover care provided in these classes of hospitals. Costs are paid by the provinces (in some cases there are contributions by municipalities or patients)

* These public assistance benefits are not shareable under federal legislation, since the benefits are not universally available.

with the exception of federal assistance under the Tuberculosis Control Grant and Mental Health Grant. All nine provincial insurance programs, however, cover psychiatric and tuberculosis care provided in general hospitals, and these costs are shared by the Federal Government under the insurance program.

Inclusion of chronic and convalescent hospital care in the insurance program is permitted under federal legislation. Prior to 1958, chronic care hospitals were not covered by the schemes in Newfoundland, Saskatchewan, Alberta and British Columbia, although many chronic patients obtained prepaid care in acute treatment hospitals. On July 1, 1958, Saskatchewan, Manitoba and Newfoundland approved certain chronic facilities for participation in the program. Ontario, Nova Scotia, New Brunswick and Prince Edward Island also included chronic and convalescent facilities when their schemes began in 1959, Alberta added chronic hospitals to its system on Apr. 1, 1959, and British Columbia has indicated plans to extend its program in this area in 1960.

Selected private hospitals providing active treatment care have been approved for payment on a contract basis in some provinces. Ontario has entered the field of nursing home care by approving selected nursing homes for the provision of benefits on an annually renewable basis. Alberta has also made provision for payment of nursing home care in the provincial program.

Federal hospitals for Indians, Eskimos, sick mariners and war veterans have been included by all nine participating provinces, mainly for general care.

Payments to Hospitals.—Although the bulk of payments to hospitals is now made by provincial hospital insurance schemes on behalf of insured beneficiaries, insured patients may be charged for non-insured services at the time of receiving hospital care, and in two provinces must pay deterrent co-insurance charges for insured services. In addition, of course, patients lacking insurance coverage and third parties such as workmen's compensation boards pay all-inclusive rates for insured services provided by the hospital, but not covered by the hospital insurance scheme.

Differential charges for private and semi-private accommodation are controlled by the provincial hospital insurance authorities. In Saskatchewan, Ontario, Nova Scotia and Newfoundland, hospitals are allowed to retain 50 p.c. of the differential and in British Columbia 40 p.c. for their own purposes. In Alberta, Manitoba, New Brunswick and Prince Edward Island, all revenues from such differential charges are deducted from hospital expenses prior to calculation of provincial payments on behalf of insured persons. Charges for non-benefit out-patient services are not controlled by hospital insurance authorities, except in Alberta. Out-patient revenues, however, are deducted from hospital budgets before provincial payments are calculated.

Co-insurance charges, payable by the patient at the time of service and deductible from provincial payments to hospitals, are authorized only in British Columbia and Alberta. In British Columbia, except for public assistance recipients and newborn infants, there is a charge of \$1 per day for in-patient service and \$2 for emergency out-patient care. In Alberta, daily authorized co-insurance charges for in-patient care, payable by the patient, vary between \$1.50 and \$2 per day depending on the size and type of the hospital; for newborn infants the charge is \$1 per day. The Alberta government pays co-insurance charges on behalf of provincial public assistance recipients, juvenile arthritis patients, cancer patients hospitalized for diagnosis up to seven days, poliomyelitis patients and maternity patients and newborn infants up to twelve days.

Provincial payments to hospitals for insured services involve a budget review system in eight of the nine participating provinces. Individual hospitals submit budgets at the beginning of the year, and the insurance authority may disapprove items. Rates of payment based on approved budgets are calculated and paid to the hospitals in a variety of ways in the different provinces. Rates of payment may be adjusted or renegotiated at any time during the course of the year. At the end of the year, rates are reviewed in conjunction with the audited financial statements of hospitals and, if necessary, retroactive adjustments are made.

In Alberta, provincial payments to the hospitals are based on costs actually incurred in the previous year, rather than on approved budgets for the current year. The annual residual operating costs for the prior year are determined by deducting all revenues from co-insurance charges, non-insured services and uninsured patients from the total operating costs of the hospital. Current payments on account are not affected by current occupancy or costs but are subject to a maximum ceiling amount fixed by Ministerial Order. Following a year-end review of the audited cost of the current year's operations, retroactive adjustments may be made to cover approved increases in current residual costs over the previous year.

The Federal Government shares hospital expenses approved as the basis for provincial payments to hospitals for insured services detailed in the federal hospital insurance regulations. These shareable costs include replacement of equipment, but exclude depreciation of buildings and interest charges. Nevertheless, several provinces have accepted varying degrees of responsibility for capital debt in both new and existing facilities as part of their hospital insurance payment provisions. As indicated earlier, all provinces participate in the matching federal-provincial Hospital Construction Grant which assists new construction.

Administration.—The administrative framework of the federal-provincial hospital insurance program is outlined in federal and provincial legislation and regulations, and is detailed in the "scheme for administration" attached to the federal-provincial agreements.

At the federal level, the hospital insurance agreements are administered by the Principal Medical Officer, Health Insurance, under the general direction of the Director of Health Services in the Health Branch of the Department of National Health and Welfare. Financial aspects are handled in co-operation with the Department of Finance and its auditors, and with the Research and Statistics Division of the Department of National Health and Welfare which is responsible for cost estimates and the calculation of final shareable costs. Service and policy aspects are administered in collaboration with the technical and consultant services available in the Health Branch, as well as consultant services from the Research and Statistics Division and the Legal Division.

The pattern of administration at the provincial level varies from province to province. In Saskatchewan and Newfoundland the hospital insurance administration is part of the Department of Health, with the Deputy Ministers of Health as the responsible officers. In Alberta and British Columbia, too, the director of hospital insurance operates within the Department of Health, but reports directly to the Minister. The other five provinces, however, with newer programs, have been influenced strongly by the Blue Cross tradition; in each case a hospital services commission has been set up separately from the health department and reports directly to the Minister of Health.

Section 2.—Health Statistics

The Dominion Bureau of Statistics, as the central statistical agency for Canada, collects, analyses and publishes statistics on health matters, and serves as a source of information for special inquiries on such subjects.

Statistical information on the health of Canadians is at present limited to the well established and highly standardized mortality, communicable disease and institutional statistics series, all of which have been available for a long period. As compared with these records, other national health statistics are still in an early stage of development. So far, the only source of information on general illness, health services and personal expenditure for health care is the Canadian Sickness Survey of 1950-51. Other projects deal with specific health problems or selected groups of the population, such as Civil Service illness and the activities of the Victorian Order of Nurses. Much statistical information is also available from provincial and other health sources.

Statistics on causes of death are given in the Chapter on Vital Statistics, pp. 249-252; those on hospital statistics in Subsection 1 following; and those on notifiable diseases in Subsection 2. A brief outline of the scope and methods of the Sickness Survey of 1950-51 is given in the 1955 Year Book and some of the results are published in the 1955, 1956 and 1957-58 editions. Details are available in bulletin form (Catalogue Nos. 82-501 to 82-511).

Subsection 1.—Hospital Statistics*

The inception, on July 1, 1958 and subsequently, of publicly administered insurance plans for general hospital care (see pp. 283-290) is likely to have profound effects upon Canadian hospital statistics; such effects are not, of course, apparent in the records for 1958 which follow.

In 1958 there were 1,402 hospitals known to be in operation in Canada; their bed capacity (not including bassinets for the newborn) was 183,405. Of the total number of institutions, 101 did not submit movement-of-patient data and somewhat larger numbers failed to report information such as personnel, facilities and finances.

Two methods of hospital classification have been used in the tables of this Subsection: one based on admission policy, i.e., public, private or federal; and the other based on type of service provided, i.e., general, allied special, mental or tuberculosis. Both bases of classification are combined in Tables 1 and 2, which show the number of hospitals of each type and their bed capacities, distributed provincially. In 1958 nearly three of every four institutions recognized by provincial authorities as hospitals were general hospitals, that is, hospitals either devoted primarily to the active treatment of a wide range of illnesses or having an active treatment unit. Such hospitals accounted for at least two of every three hospitals in each province except Quebec, where the ratio was about one in two. As might be expected, the ranking of the provinces in terms of population corresponds closely with their order in number of hospital beds, but not with their rank in number of hospitals. Saskatchewan has many small hospitals and, in 1958, was second to Ontario in number of general hospitals. Bed capacity per 10,000 population was highest in Prince Edward Island, the Prairie Provinces and the Territories (all over 100.0). Except for Newfoundland's 71.1, capacity per 10,000 population ranged between 84.8 and 98.2 in the other provinces.

* Prepared in the Institutions Section of the Health and Welfare Division, Dominion Bureau of Statistics. Detailed information will be found in the following DBS publications: *Hospital Statistics, Vols. I and II* (Catalogue Nos. 83-202 and 83-203); *Mental Health Statistics* (Catalogue No. 83-204) and *Financial Supplement* (No. 83-205); *Tuberculosis Statistics* (No. 83-206) and *Financial Supplement* (No. 83-207).

¹ Based on population as at June 1, 1958.

Movement of Patients and Patient-Days.—Table 3 shows the changing pattern of hospital utilization over the 1954-58 period. The absolute number of admissions increased by 23.6 p.c. but the ratio per 100,000 population increased by 10.8 p.c. Year-by-year gains, however, proceeded at a declining rate during the five-year period because of downward trends in numbers of admissions to tuberculosis sanatoria, maternity hospitals

and "other" hospitals (special hospitals not specified as to type of service). Concurrently with the 23.6 p.c. rise in admissions, patient-days increased by only 10.9 p.c., indicating a shorter average length of stay per patient in 1958 than in 1954. The number of patients in hospital at year-end per 100,000 population remained remarkably constant over the period—938 on Dec. 31, 1954 and 932 on Dec. 31, 1958. Despite the over-all ratio (in rated-capacity terms) of 16 general hospital beds to every 10 beds in mental institutions, there was a difference of less than 10 p.c. between the number of patients in reporting general hospitals (70,649) and the number in mental institutions (64,188) on Dec. 31, 1958.

¹ Mental hospitals only; does not include psychiatric or mental units of general hospitals.

² Tuberculosis hospitals only; does not include tuberculosis units of general hospitals.

Diagnoses of Patients in Mental Institutions and Tuberculosis Sanatoria.—Tables 5 and 6 summarize the most recent data available on diagnoses according to age and sex of patients on the books of mental institutions and tuberculosis sanatoria, including patients in related units located in general hospitals.

Of the 70,311 mentally ill patients on record at Dec. 31, 1957, 65.7 p.c. had been diagnosed as psychotics, 30.8 p.c. as mental defectives, alcoholics and persons otherwise affected by disorders of character, behaviour and intelligence, and 2.3 p.c. as psychoneurotics. More men than women had been institutionalized for disorders of character, behaviour and intelligence; the largest frequencies of both sexes occurred in the 10-19 age group and diminished in each age group thereafter. Similarly, more men than women (except those 70 years of age or over) had been diagnosed as psychotic. However, in all age groups, nearly twice as many women as men had required hospitalization for conditions diagnosed as psychoneurotic. The incidence among hospitalized psychoneurotics, both male and female, was highest at ages 40-49.

5.—Diagnoses of Patients on the Books of Reporting Mental Hospitals, by Class, and by Age and Sex, 1957

NOTE.—Special census data available for 1957 only. Figures include patients in 79 mental hospitals and also patients in psychiatric and in mental units of general hospitals.

¹ Includes age groups not known.

Among patients reported as on the books of tuberculosis institutions at the end of 1958, the peak frequency for men (1,001) occurred in the 50-59 age group, and for women (789) in the 20-29 age group. More men than women were listed in each age group except those encompassing ages 10-29. Compared with 1,001 men, only 338 women between the ages of 50 and 59 were carried on the books of tuberculosis sanatoria and units at Dec. 31, 1958; in contrast, the peak frequency for women aged 20-29 (789) was closely approximated in number by male patients (784).

6.—Diagnoses of Patients on the Books of Reporting Tuberculosis Hospitals, by Class, and by Age and Sex, 1958

NOTE.—Figures include patients in 82 tuberculosis hospitals and also patients in tuberculosis units of general hospitals.

Facilities.—Table 7 shows the prevalence of special facilities in public and federal hospitals distributed by province. Nationally, over 75 p.c. of these hospitals were equipped with radiology, clinical laboratory and out-patient facilities, but fewer than 50 p.c. with physiotherapy facilities. Among other factors, the type of service offered in a hospital determines to some extent the facilities provided. For example, about 84 p.c. of the general hospitals reported radiology, clinical laboratory and out-patient facilities, and nearly half of these hospitals provided physiotherapy facilities. On the other hand, only just over one of every three mental institutions had clinical laboratory, physiotherapy and out-patient facilities, although about two of every three had radiology facilities. Among tuberculosis institutions, slightly more than three of every four were equipped with radiology facilities, about 85 p.c. with clinical laboratory, and only about one of every three with physiotherapy and out-patient facilities. Fewer than one-third of "other" hospitals provided radiology, clinical laboratory and out-patient facilities, while slightly more than one-third were equipped for physiotherapy.

7.—Facilities of Reporting Public and Federal Hospitals, by Province, 1958

NOTE.—Adequate information on the facilities of private hospitals is not available.

¹ Two sanatoria reported as one hospital.

Personnel.—Table 8 shows the provincial distribution at the end of 1958 of hospital-paid personnel in health institutions classified according to type of service. General hospitals, with active treatment as their prime concern, had a relatively high ratio of 1,600.0 full-time and part-time employees per 1,000 beds, and well over three times more nursing personnel per 1,000 beds than hospitals of any other type. The highest ratio of medical staff per 1,000 beds was observable in tuberculosis institutions. Provincially, total staff and nursing personnel ratios were highest in Ontario for general hospitals (1,819.6 and 762.5 respectively); in Newfoundland for mental institutions (875.4 and 418.5); and in Nova Scotia for "other" hospitals (1,378.8 and 734.8). Among tuberculosis sanatoria, those in Nova Scotia employed the largest total staffs, and those in British Columbia the largest nursing staffs per 1,000 beds of rated capacity.

hospitals only; does not include tuberculosis units in general hospitals.

Finances.—Table 9 gives summary financial statistics for 1958 with respect to reporting public hospitals. Such institutions incurred total net expenditures of \$570,900,000, the equivalent of \$10.35 per patient-day, which was 99 cents more for each day of patient care than in 1957. At the same time, total income amounted to \$545,400,000—\$25,500,000 less than operating costs. Both income and expenditure advanced from their respective 1957 levels of \$490,100,000 and \$510,700,000 at approximately similar rates; as a result, “operating deficit” was \$4,833,000 more at the end of 1958 than one year earlier. For “other” hospitals, costs incurred for salaries and wages amounted to 91.0 p.c. of net patient earnings; for general hospitals, to 74.5 p.c. However, since provincial government funds accounted for most of the revenue of mental institutions and tuberculosis sanatoria, such costs for the former amounted to more than seven times the value of net patient earnings, and for the latter to over 73 times the amount earned from patients. For general hospitals, total costs per patient-day were highest in British Columbia (\$17.56); for tuberculosis sanatoria and “other” hospitals, in Alberta (\$14.84 and \$16.34, respectively); and for mental institutions, in Newfoundland (\$6.71).

9.—Revenues and Expenditures of Reporting Public Hospitals, by Type of Hospital and by Province, 1958

Subsection 2.—Notifiable Disease and Other Health Statistics*

Health statistics collected nationally—in addition to statistics of hospitals dealt with at pp. 291-306—cover notifiable diseases, illness among federal civil servants, and home nursing services. The first two series are dealt with briefly below; the third series is based on the experience of the Victorian Order of Nurses for Canada which is the major home nursing organization in the country. Results of the latter annual survey are available in duletin form (Catalogue No. 82-202).

Notifiable Diseases.—Notifiable diseases are essentially communicable diseases, reportable according to provincial health regulations. The progress that has been made toward the successful treatment and eradication of such diseases is indicated by the fact that the proportion of total deaths attributable to notifiable diseases dropped from 9.4 p.c. in 1931 to 1.0 p.c. in 1958, and the death rate from 94.9 per 100,000 population to 8.3. The incidence of such diseases in 1958 in the various provinces is shown in Table 10, with comparable totals for 1957.

Significant decreases in 1958 over 1957 were noted for diphtheria (53.5 p.c.), epidemic influenza (97.2 p.c.), mumps (40.3 p.c.), and rubella (German measles) (54.8 p.c.). The influenza total for 1958 portrays a more normal incidence of this disease than the 1957 total, since the latter was inflated by the Asian influenza epidemic that occurred in the autumn of that year.

In October 1958, the Dominion Council of Health, working in co-operation with provincial authorities, recommended the elimination of needless reporting of certain diseases that no longer constitute a serious health problem in Canada, including chickenpox, measles, mumps and German measles. As a result, national statistics will no longer carry information on these diseases. Other changes involved the modernizing of certain terminology, for example, the replacing of "non-paralytic poliomyelitis" with "viral or aseptic meningitis". Such changes have been incorporated in the 1959 reporting of notifiable diseases.

* Prepared in the Public Health Section of the Health and Welfare Division, Dominion Bureau of Statistics.

¹ Includes Yukon but excludes Northwest Territories.² Includes cases where type was not specified.³ Includes cases of streptococcal sore throat.⁴ Less than 0.05 per 100,000 population.

Illness in the Federal Civil Service.—A study of the incidence and duration of illness among federal civil servants is made annually from data supplied by medical certificates, which are required for all absences of more than three days at one time and for

absence of any duration after eight days of casual leave have been taken. During the calendar year 1958, of an estimated 139,800 civil servants covered by Civil Service Leave Regulations, 45,820 reported ill by medical certificate. The number of new illnesses, as certified by medical certificate, was 68,489, somewhat lower than the 71,167 reported for 1957. Similarly, the number of days of completed illnesses decreased to 1,039,449 in 1958 from the 1,127,196 reported for 1957. Other relevant statistics for 1958 indicate that, on the average, 7.5 working days were lost through illness by each employee, including 4.9 days certified and 2.6 days casual sick leave.

Several new indices related to sickness absenteeism were calculated from the 1958 survey, based on the number of certified illnesses that occurred at some time during the year but not necessarily completed during the same year. These illnesses totalled 71,175. The severity rate or average number of calendar days per illness was 14 and the average number of working days was 9.7. The frequency rate or the average number of illnesses per 100 employees was 50.9. In addition, for each working day during the year, about two of every 100 civil servants were absent on certified sick leave.

PART II.—PUBLIC WELFARE AND SOCIAL SECURITY

Responsibility for social welfare is shared by all levels of government. Costly income maintenance measures such as old age security and family allowances, or programs such as unemployment insurance and the National Employment Service where nation-wide co-ordination is required are administered federally. Substantial federal aid is given to the provinces in meeting the costs of social assistance. The Federal Government also provides services for special groups such as Indians, Eskimos and immigrants.

The Department of National Health and Welfare is the agency generally responsible for federal welfare matters; the Departments of Veterans Affairs, Citizenship and Immigration, and Northern Affairs and National Resources also operate important programs. The Unemployment Insurance Commission is responsible for the operation of unemployment insurance and the National Employment Service.

Administration of welfare services is primarily a responsibility of the province but the provision of services is often assumed by local authorities, generally with financial aid from the province.

Section 1.—Federal Government Programs

Subsection 1.—Family Allowances

The Family Allowances Act of 1944 is designed to assist in providing equal opportunity for all Canadian children. The allowances do not involve a means test and are paid entirely from the federal Consolidated Revenue Fund. They do not constitute taxable income but there is a smaller income tax exemption for children eligible for allowances.

Allowances are payable in respect of every child under the age of 16 years who was born in Canada, or who has been a resident of the country for one year, or whose father or mother was domiciled in Canada for three years immediately prior to the birth of the child. Payment is made each month, normally to the mother, although any person who substantially maintains the child may be paid the allowance on his behalf. Allowances are paid at the monthly rate of \$6 for each child under 10 years of age and \$8 for each child 10 or over but under 16 years. The allowances are paid by cheque, except for some Eskimo and Indian children in remote areas for whom payment is made largely in kind because of lack of exchange facilities and the desirability for education in the use of nutritive foods.

If the allowances are not spent for the purposes outlined in the Act, payment may be discontinued or made to some other person or agency on behalf of the child. Allowances are not payable for any child who fails to comply with provincial school regulations or on behalf of a girl who is married and under 16 years of age.

The program is administered by the Department of National Health and Welfare through regional offices located in each provincial capital. A welfare section in each regional office deals with welfare questions arising from administration of the allowances. Issuing of the cheques is the responsibility of the treasury division of each regional office, which reports to the Chief Treasury Officer of the Department of Finance attached to the Department of National Health and Welfare. The Regional Director for the Yukon and Northwest Territories is located in Ottawa.

Through the Department of Citizenship and Immigration, the Federal Government pays family assistance at the rate of \$5 a month for each child under 16 years of age supported by an immigrant who has landed for permanent residence in Canada, or by a Canadian returning to Canada to reside permanently. This allowance, which is paid quarterly and for a maximum period of one year, is not payable to a child receiving family allowances.

Subsection 2.—Old Age Security

The Old Age Security Act of 1952, as amended, provides a universal pension of \$55 a month, payable by the Federal Government to all persons aged 70 or over, subject to a residence qualification. To qualify for pension a person must have resided in Canada for ten years immediately preceding its commencement or, if absent during that period, must have been actually present in Canada prior to it for double any period of absence and must have resided in Canada at least one year immediately preceding commencement of pension. A 1960 amendment to the Act provides that payment of pension may be continued for any period of residence outside Canada if a pensioner has resided in Canada for at least 25 years after attaining the age of 21 or, if he has not, it may be continued for six consecutive months exclusive of the month of departure from Canada.

Until Jan. 1, 1959, the pension was financed on a pay-as-you-go method through a 2-p.c. sales tax, a 2-p.c. tax on corporation income and, subject to a limit of \$60 a year, a 2-p.c. tax on personal income. Effective Jan. 1, 1959, the tax on corporation income and from Apr. 9, 1959, the sales tax, were raised to 3 p.c. The rate on taxable personal income was raised, as from July 1, 1959, to 2.5 p.c., with a maximum of \$75 for 1959. Beginning with 1960, the rate on taxable personal income was raised to 3 p.c., with a maximum of \$90 a year. Taxes are paid into the Old Age Security Fund. If they are insufficient to meet

the pension payments, temporary loans or grants are made from the Consolidated Revenue Fund. The pension is paid from the Consolidated Revenue Fund and charged to the Old Age Security Fund. The program is administered by the Department of National Health and Welfare through regional offices located in each provincial capital.

Persons in receipt of old age assistance (see p. 314) who reach age 70 are automatically transferred to old age security. Others make application to the regional office.

British Columbia, Alberta and Saskatchewan make supplementary payments to those recipients of old age security who qualify under a means and residence test. In British Columbia the allowance may not exceed \$24 a month, in Alberta \$15 a month, and in Saskatchewan it is a minimum of \$2.50 a month rising to a maximum of \$10 a month. In Ontario, the provincial government shares to the extent of 80 p.c. in the first \$20 a month of supplement paid by a municipality to a needy recipient of old age security. In Manitoba, the province may reimburse a municipality for 80 p.c. of the supplementary assistance paid to needy recipients of old age security. In some provinces and in Yukon Territory, recipients of the pension who are in special need may be eligible for relief.

Subsection 3.—Government Annuities*

Under the Government Annuities Act (RSC 1952, c. 132) passed in 1908, the Federal Government carries on a service to assist Canadians to make provision for old age. The Act is administered by the Minister of Labour.

A Canadian Government annuity is a fixed yearly income purchased from and paid by the Government of Canada. The annuity is payable in monthly instalments for life, or for life and guaranteed for a period of years. The minimum annuity is \$10 and the maximum \$1,200 a year or the actuarial equivalent if the annuity is to reduce by the amount of payments under the Old Age Security Act. Annuity contracts may be deferred or immediate. Deferred annuities are purchased by periodic or single premiums. Immediate annuity contracts provide immediate income. Annuities may be arranged to reduce by \$55 a month at age 70 to fit in with payments under the Old Age Security Act.

The property and interest of the annuitant are neither transferable nor attachable. In the event of the death of the annuitant before a deferred annuity vests, all money paid is refunded with interest. Provision is made in the Act for group annuity contracts whereby employers may contract for the purchase of annuities on behalf of their employees, or associations on behalf of their members, the purchase money being derived partly from wages and partly from employer contributions or entirely from employer contributions. Group annuity plans now in effect cover a variety of industries and many municipal corporations throughout Canada. Annuities arising from individual contracts may be taxable in either of two ways: (1) if registered under Sect. 79B of the Income Tax Act for tax exemption on premiums, the annuity is fully taxable, or (2) if not registered the annuity is taxable on the interest portion only. Annuities arising from approved pension plans are fully taxable but the employee and the employer are entitled to tax exemption year by year on their annual contributions to the pension plan.

From Sept. 1, 1908, the date of the inception of the system, to Mar. 31, 1959, the total number of annuity contracts and certificates issued, excluding replacements, was 475,402. On the latter date 78,986 annuities were being paid amounting to \$41,497,049 annually and 343,957 deferred annuities were being purchased. The net total amount of purchase money received up to Mar. 31, 1959 was \$1,165,795,515.

Up to Mar. 31, 1959, 1,195 corporations, institutions and associations, as compared with 1,133 up to Mar. 31, 1958, had entered into agreements with the Government to purchase annuities. Under these arrangements 204,853 employees or members were holding certificates for purchase of deferred annuities as compared with 192,820 one year earlier. The number of group certificates issued in the year ended Mar. 31, 1959 was 18,043 as compared with 11,236 for 1957-58.

* Revised in the Government Annuities Branch, Department of Labour, Ottawa.

Subsection 4.—Other Federal Government Programs

Unemployment Insurance and National Employment Service.—In 1940, by an amendment to the British North America Act, the Federal Government was given jurisdiction in the field of unemployment insurance and the Unemployment Insurance Act was passed, establishing a national system of unemployment insurance which is outlined in Chapter XVII.

The National Employment Service is operated in conjunction with the unemployment insurance scheme. It is administered through local employment and claims offices and supervised by the Department of Labour. Statistics of positions offered and placements made are given in Chapter XVII.

Prairie Farm Assistance.—The Prairie Farm Assistance Act is administered by the Department of Agriculture; a description of the legislation is given in Chapter IX.

Welfare Services for Indians and Eskimos.—The welfare of Indians and Eskimos is administered by the Department of Citizenship and Immigration and the Department of Northern Affairs and National Resources, respectively; this field is covered in the Population Chapter, pp. 201-210.

Section 2.—Federal-Provincial Programs

Subsection 1.—Old Age Assistance

The Old Age Assistance Act of 1952, as amended November 1957, provides for federal reimbursement to the provinces for assistance to persons aged 65 or over who are in need and who have resided in Canada for at least ten years or who, if absent from Canada during this period, have been present in Canada prior to the commencement of the ten-year period for double any period of absence. On reaching age 70 a pensioner is transferred to old age security. The federal contribution may not exceed 50 p.c. of \$55 a month or of the assistance paid, whichever is less. The province administers the program and, within the limits of the federal Act, may fix the amount of assistance payable, the maximum income allowed and other conditions of eligibility. All provinces and territories pay a maximum \$55 a month.

For an unmarried person, total income allowed, including assistance, may not exceed \$960 a year. For a married couple it may not exceed \$1,620 a year or, when the spouse is blind within the meaning of the Blind Persons Act, \$1,980 a year. Assistance is not paid to a person receiving an old age security pension or an allowance under the Blind Persons Act, the Disabled Persons Act, or War Veterans Allowance Act.

British Columbia, Alberta and Yukon Territory make supplementary payments to recipients of old age assistance who qualify under a means and residence test. In British Columbia the allowance may not exceed \$20 a month, in Alberta \$15 a month, and in the Yukon \$10 a month. In Ontario, the provincial government shares to the extent of 80 p.c. in the first \$20 a month of the supplement paid by a municipality to a needy recipient of old age assistance. In Manitoba, the province is empowered to reimburse a municipality for 80 p.c. of the supplementary assistance it pays to recipients of old age assistance. In some provinces and in the Yukon, recipients of old age assistance who are in special need may be eligible for relief.

¹ During fiscal year maximum assistance was raised from \$30 to \$40 per month.

² During fiscal year maximum raised from \$40 to \$55 a month.

³ During fiscal year monthly maximum raised from \$40 to \$46; raised to \$55 in May 1958, retroactive to Nov. 1, 1957.

Subsection 2.—Allowances for Blind Persons

The Blind Persons Act of 1952, as amended November 1957, provides for federal reimbursement to the provinces for allowances to blind persons aged 18 or over who are in need and who have resided in Canada for at least ten years. The federal contribution may not exceed 75 p.c. of \$55 a month or of the allowance paid, whichever is less. The province administers the program and, within the limits of the federal Act, may fix the amount of allowance payable and the maximum income allowed. All provinces pay a maximum of \$55 a month.

To qualify for an allowance a person must meet the required definition of blindness and have resided in Canada for ten years immediately preceding commencement of allowance or, if absent from Canada during this period, must have been present in Canada prior to its commencement for a period equal to double any period of absence.

For an unmarried person, total income including the allowance may not exceed \$1,200 a year; for a person with no spouse but with one or more dependent children, \$1,680; for a married couple, \$1,980. When the spouse is also blind, income of the couple may not exceed \$2,100. Allowances are not payable to a person receiving assistance under the Old Age Assistance Act, an allowance under the Disabled Persons Act or the War Veterans Allowance Act, a pension under the Old Age Security Act or a pension for blindness under the Pensions Act.

British Columbia, Alberta, Saskatchewan and Yukon Territory make supplementary payments to recipients of blindness allowances who qualify under income and residence tests. In British Columbia a flat rate allowance of \$24 a month is payable, in Alberta the supplement may not exceed \$15 a month, and in the Yukon \$10 a month. In Saskatchewan, a minimum of \$2.50 a month is payable, rising to a maximum of \$10 a month. In Ontario, the government shares to the extent of 80 p.c. in the first \$20 a month paid by a municipality to a needy recipient. In Manitoba, the province is empowered to reimburse a municipality for 80 p.c. of the supplementary assistance it pays to recipients of allowances for blind persons. In some provinces and in the Yukon, recipients in special need may also be eligible for relief.

¹ During fiscal year maximum assistance was raised from \$40 to \$55 a month.² During fiscal year maximum raised from \$40 to \$46 a month; raised to \$55 a month in May 1958, retroactive to Nov. 1, 1957.

Subsection 3.—Allowances for Disabled Persons

The Disabled Persons Act of 1954, as amended November 1957, provides for federal reimbursement to the provinces for allowances paid to permanently and totally disabled persons aged 18 or over who are in need and who have resided in Canada for at least ten years immediately preceding commencement of allowance or, if absent from Canada during this period, have been present in Canada prior to its commencement for a period equal to double any period of absence. To qualify for an allowance a person must meet the definition of permanent and total disability set out in the Regulations to the Act. The federal contribution may not exceed 50 p.c. of \$55 a month or of the allowance paid, whichever is less. All provinces and territories pay a maximum of \$55 a month. The province administers the program and, within the limits of the federal Act, may fix the amount of allowance payable, the maximum income allowed and other conditions of eligibility.

For an unmarried person, total income including the allowance may not exceed \$960 a year. For a married couple the limit is \$1,620 a year except that if the spouse is blind within the meaning of the Blind Persons Act, income of the couple may not exceed \$1,980 a year. Allowances are not paid to a person receiving an allowance under the Blind Persons Act or the War Veterans Allowance Act, assistance under the Old Age Assistance Act, a pension under the Old Age Security Act, or a mother's allowance.

The definition of permanent and total disability employed under the Act requires that a person must be suffering from a major physiological, anatomical or psychological impairment, verified by objective medical findings. The impairment must be one that is likely to continue indefinitely without substantial improvement and that will severely limit activities of normal living.

The allowance is not payable to a patient in a mental institution or tuberculosis sanatorium. A recipient who is resident in a nursing home, an infirmary, a home for the aged, an institution for the care of incurables or a private, charitable or public institution is eligible for the allowance only if the major part of the cost of his accommodation is being paid by himself or any other individual. When a recipient is required to enter a public or private hospital, the allowance may be paid for no more than two months of hospitalization in a calendar year, excluding months of admission and release, but for the period that a recipient is in hospital for therapeutic treatment for his disability or rehabilitation, as approved by the provincial authority, the allowance may continue to be paid. The

provincial authority must suspend the payment of the allowance when in its opinion the recipient unreasonably neglects or refuses to comply with or to avail himself of training, rehabilitation or treatment facilities provided by or available in the province.

In the fourth year of the program, disabilities in the two medical classes, mental, psychoneurotic and personality disorders, and diseases of the nervous system and sense organs were again found to be most prevalent among those persons becoming eligible for an allowance. These classes alone accounted for 47.5 p.c. of the new cases, an increase over the 41 p.c. in the year ended Mar. 31, 1958. Other classes, however, such as diseases of the bones and organs of movement, and diseases of the circulatory system, continued to decline. Mental deficiency, the most frequently occurring disability, rose from one-sixth to over one-fifth of all cases granted an allowance.

British Columbia pays a flat rate supplement of \$24 a month to recipients of disability allowances who qualify under a residence test. In Ontario, the government shares to the extent of 80 p.c. in the first \$20 a month paid by a municipality to a needy recipient. In Manitoba, the province is empowered to reimburse a municipality for 80 p.c. of the supplementary assistance it pays to needy recipients of disability allowances. In some provinces and in Yukon Territory, recipients in special need may also be eligible for relief.

¹ During fiscal year maximum payment increased from \$40 to \$55 a month.

² Excluding Yukon Territory.

Subsection 4.—Unemployment Assistance

Under the Unemployment Assistance Act of 1956 as amended, the Federal Government may share with a province and its municipalities 50 p.c. of the cost of financial assistance to unemployed persons. A 1957 amendment deleted a provision under which federal reimbursement is made only in respect of recipients in excess of 0.45 p.c. of the provincial population. No distinction is made in the legislation between the employable and the unemployable.

Reimbursement is made to the province for payments within the existing provincial framework of general assistance. The scale and conditions of relief payments to recipients continue to be determined by the provinces and municipalities, except that the province agrees not to make length of residence a condition for the receipt of assistance when an applicant comes from another province which has signed a similar agreement.

The Act excludes federal reimbursement for payments for persons receiving mothers' allowances. While it also generally excludes inmates of public and charitable institutions, it provides for federal sharing of provincial and municipal payments for those in certain types of homes for special care. Those receiving various types of social security payments under other programs are also excluded but the Federal Government shares with the provinces any additional relief payments, other than cost-of-living bonuses or across-the-board pension supplements, made to such persons who are unemployed and in need. Health care and administration costs are also excluded from Federal Government reimbursement.

Agreements for the payment of federal assistance, effective July 1, 1955, were made with five provinces—Newfoundland, Prince Edward Island, Manitoba, Saskatchewan and British Columbia. New Brunswick and Ontario entered the scheme, effective Jan. 1, 1956 and Dec. 1, 1956, respectively; and Nova Scotia and Alberta, effective Jan. 1, 1958. At the end of 1958 the Northwest Territories signed an agreement effective Jan. 1 of that year and in 1959 Quebec and Yukon Territory entered into agreements effective July 1, 1958 and Jan. 1, 1959, respectively. All parts of Canada were thus participating in the program in 1959, though at the end of the year reimbursement claims covering the period of the agreement had not been received from Quebec or the Yukon.

Section 3.—Provincial Programs

Subsection 1.—Mothers' Allowances

All provinces make statutory provision for allowances to needy mothers who are deprived of the breadwinner and are unable to maintain their dependent children without assistance. Mothers' allowances programs, whether set out in separate Acts or included in general assistance legislation are, in most provinces, administered as separate programs. However, in British Columbia, since Sept. 1, 1958, aid has been provided to needy mothers as to other needy persons under the social assistance program. Therefore the following remarks do not apply to British Columbia, although Table 11 includes data for that province for the year ended Mar. 31, 1958.

Subject to conditions of eligibility which vary from province to province, mothers' allowances are payable from provincial funds to applicants who are widowed or whose husbands are mentally incapacitated and, except in Alberta, to those whose husbands are physically disabled and unable to support their families. They are also payable to deserted wives who meet specified conditions; in several provinces to mothers who are divorced or legally separated; in some, to unmarried mothers; and in Ontario and Quebec to certain Indian mothers. Foster mothers may be eligible under particular circumstances in most provinces.

The number of families and children assisted and amounts of benefits paid as at Mar. 31, 1958 and 1959 are given in Table 11 and rates of benefit as at July 1959 in Table 12.

12.—Maximum Monthly Rates under Provincial Mothers' Allowances Legislation, July 1959

Province	Mother and One Child	Each Additional Child	Disabled Father at Home	Family Maximum	Supplementary
Nfld.....	Food: \$33 or \$37 depending on age of child. Clothing: to \$9 for child under age 6, to \$3 for child age 6 and under age 16, to \$5 for person age 16 or over. Rent: up to \$20 monthly in rural and to \$30 monthly in urban areas. Fuel: up to \$10.	\$8 for each child under age 16, \$12 for each child age 16 or over.	\$20	None set.	In special circumstances up to \$30 a month additional if necessary for proper support of family.
P.E.I.....	\$45	\$5	No additional allowance granted.	\$75	None granted.
N.S.....	No set maximum; rates are based on average family income for community in which family lives.		Included in budget on which allowance is based.	\$90	None granted.
N.B.....	\$35	\$10	No additional allowance granted.	\$80	Director may grant an additional \$10 for rent if circumstances require it but only if allowance paid is below maximum.
Que.....	\$60	\$10	\$10	None set (minimum granted \$5).	A supplementary allowance of \$5 may be paid to a beneficiary incapable of working. Where need exists a special monthly allowance may be paid under the Quebec Public Charities Act through the municipality or a social agency. The cost is met in large part by the province, with some contribution by the municipality.

1 Allowances to needy mothers are paid under the Social Assistance Act.

12.—Maximum Monthly Rates under Provincial Mothers' Allowances Legislation, July 1959—concluded

Province	Mother and One Child	Each Additional Child	Disabled Father at Home	Family Maximum	Summary
Ont.	\$120 for mother or father and one child. \$30 for one child living with foster mother.	\$16 for 2nd child \$14 for 3rd child \$12 for 4th child \$10 for 5th child \$8 for 6th child \$25 for 2nd foster child \$15 for each additional foster child.	Included in budget on which allowance is based.	\$180	An increase in food allowance may be granted on medical recommendation. A fuel allowance of up to \$24 a month may be granted from Sept. 1 to Mar. 31. An increase of 20 p.c. in fuel allowance may be granted under special circumstances.
Man.	Food, clothing and utilities; \$47- \$59 depending on age of child. Shelter; rent to \$55, or taxes, insurance and minor repairs up to \$20 plus principal and interest on mortgage or agreement for sale and necessary repairs.	\$14 for child up to 3 years \$16 for child 4-6 years \$21 for child 7-11 years \$26 for child 12-18 years (Subject to deductions for fourth and each additional child).	\$25	None set.	\$10 monthly if family has no income. In case of extraordinary need up to \$180 a year may be granted; if housekeeper service is required this amount may be exceeded. Fuel allowance granted for eight months.
Sask.	\$60 \$35 for one child living with a guardian.	\$10 \$20 for each child living with guardian.	\$20 Also if confined to a nursing home or sanatorium.	\$150 \$170 if disabled father at home, in nursing home or sanatorium.	The local municipality may grant supplementary aid under the Social Assistance program. In unorganized territories the province assumes full cost.
Alta.	\$70	\$20 for 2nd and 3rd child \$15 for 4th to 6th child \$10 for 7th to 9th child.	Not applicable.	\$185	Municipalities of residence may grant additional aid, 80 p.c. of the cost of which is reimbursed by the province; in unorganized territories the province assumes full cost.
B.C.	Allowances to needy mothers provided with other types of allowance under the Social Assistance Act, and not separable.	

The age limit for children varies from 15 years in one province to 18 in another with provision made in most provinces to extend payment for a specified period if the child is attending school or if he is physically or mentally handicapped. In all provinces applicants must satisfy conditions of need and residence but the amount of outside income and resources allowed and the length of residence required prior to application vary, the most common period being one year, although in one province it is five years. Three provinces have citizenship requirements.

In each province the relevant Act is administered by public welfare authorities. In some provinces a Mothers' Allowances Board or Commission makes the final decision regarding eligibility and the amount of allowances granted, or acts in an advisory capacity.

Subsection 2.—Provincial and Local Welfare Services

General assistance or relief and the various welfare services associated with this form of aid, as well as the care of the aged and the protection and care of neglected and dependent children, are governed by provincial welfare legislation. Administrative and financial responsibility is shared by the province and its municipalities to a varying extent. Provincial administration of welfare as of other provincial assistance is carried out through the department of public welfare or of health and welfare in each province. Several provincial welfare departments have established regional offices for administrative purposes and to provide consultative services to the municipalities.

Significant changes have taken place in provincial programs in the past few years. New or revised legislation or new procedures in a number of provinces have laid the foundation for improved standards of service and administration, and re-appraisal of services is continuing.

Notable program changes in the field of general assistance or residual aid have been accompanied in several provinces by re-distribution of costs between the province and the municipalities, and progress has been made in setting up minimum standards of administration and encouraging uniform rates of assistance throughout the province. The financial contribution of the Federal Government to the provinces for unemployment assistance (see p. 319) has doubtless been an important contributing factor in the realignment of provincial-municipal responsibilities.

All provinces are giving some consideration to the need for integrated planning on behalf of older citizens. A number have increased their capital or maintenance grants to municipalities and to voluntary groups for homes for the aged and are also assisting in the construction of low-rental housing projects.

The main efforts in child welfare have been directed toward improvement of standards and greater flexibility of services, with particular emphasis on preventive casework services for children in their own homes, development of specialized children's institutions and the finding of adoption homes for all children in need of them.

An impressive number of voluntary agencies also contribute to community welfare including the welfare of families and children and of groups with special needs, such as the aged, recent immigrants, youth groups, and released prisoners. Family welfare agencies or combined family and child welfare agencies in urban centers, for example, offer casework services to families in need of counselling on such problems as marital relations, parent-child relations and family budgeting. Counselling and recreational services for older or retired people are being developed by many agencies and child and youth organizations with recreational and character-building programs offer group participation in physical education, camping, the development of special skills, and other opportunities for healthful activity. Welfare councils and community planning councils contribute to the planning and co-ordinating of local welfare services.

Local voluntary agencies and institutions are usually incorporated under provincial law. They may receive public grants, depending on the nature and standard of the services they render, although, with the exception of the semi-public children's aid societies, their main support may be from united funds or community chests, or from sponsoring organizations.

Welfare services, public and private, are hampered by the continued shortage of qualified social workers. Short university courses in social work, periodic study institutes, and a more formal approach than in the past to in-service training are being developed to improve staff qualifications. A number of provincial departments are granting education leave with pay or bursaries to enable selected staff to attend schools of social work.

General Assistance.—All provinces make legislative provision for general assistance on a means-test basis to needy persons and their dependants who cannot qualify for other forms of aid, and some provinces include those whose benefits under other programs are not adequate. This assistance, with some exceptions, is administered by the municipality with substantial financial support from the province. In most provinces assistance is given for food, clothing, shelter and utilities, but it may also include incapacitation or rehabilitation allowances, post-sanatorium allowances, maintenance costs of boarding or nursing home care, counselling, and homemaking services.

The provincial departments of public welfare usually have regulatory powers over municipal administration of general assistance. Several provinces recommend rates of assistance as a guide to municipalities, and some specify rates at which payments must be paid if a municipality is to qualify for provincial reimbursement. Specified standards of administration may also be a requirement. The province may take the responsibility for aid in unorganized areas and for the cost of aid to certain categories of persons, such as transients. With the introduction of reimbursement plans designed to equalize municipal responsibility, British Columbia and Saskatchewan have abolished municipal residence requirements. In other provinces the residence of the applicant, as defined by statute, determines the financially responsible authority.

The length-of-residence requirement for social assistance is variously calculated but, in general, it is one year. Under the Unemployment Assistance Act, however, all provinces have agreed that residence shall not be a condition of assistance for applicants who come from other provinces. For other types of assistance, a person without the required length of residence in a province may be given aid by the province or the municipality, for which a chargeback may or may not be made to the municipality of residence. On the other hand, the applicant, depending on individual circumstances and the policy of the province, may be returned to his place of residence.

Various financial arrangements are in effect for sharing the costs of general assistance between the province and the municipality. In Newfoundland, such assistance is the responsibility of the province and is administered by the Department of Public Welfare. In Prince Edward Island, the Department of Welfare and Labour provides direct social assistance in rural areas and assumes 75 p.c. of the cost of assistance granted by the City of Charlottetown and the incorporated towns and villages. The Department also operates a province-wide program of financial aid to families where the breadwinner is suffering from tuberculosis and is unable to support the family. In Nova Scotia, social assistance is administered by the municipality, which receives reimbursement from the Department of Public Welfare for two-thirds of the cost of assistance given and one-half of the cost of administration. In New Brunswick, relief to needy persons is a local responsibility and may be discharged through the provision of institutional aid, although individual relief is provided by an increasing number of municipalities.

In Quebec, assistance to indigent persons is frequently given in the form of institutional care but may also be provided through some municipal departments and private agencies. Costs are shared by the provincial Department of Social Welfare, the municipality and, where applicable, by the institution. Cities and towns bear 24 p.c. of the cost, rural municipalities 15 p.c., the institution 33½ p.c., and the province the remainder. In Ontario, the

Department of Public Welfare reimburses municipalities, up to a prescribed maximum, for 80 p.c. of their expenditures on aid to needy persons and on incapacitation allowances for single needy handicapped residents.

The Social Allowance Act of Manitoba, passed in 1959, transferred from the municipalities to the province responsibility for administering and financing aid to mentally or physically incapacitated persons whose disability is likely to last more than 90 days, and to persons unable to work because of their age. Aid to other needy persons, termed "indigent relief", remains under the municipalities. The Department of Health and Public Welfare reimburses the municipalities to the extent of 40 p.c. of the costs, or at a higher rate if costs exceed a specified amount. In Saskatchewan, through the Department of Social Welfare and Rehabilitation, the province bears approximately 93 p.c. of the cost of assistance granted by the municipalities to needy persons. The municipalities are assessed annually on a per capita basis for about 7 p.c. of the over-all cost of social aid, and the province reimburses each municipality for all actual expenditures. In Alberta, the province reimburses the municipalities for 80 p.c. of the value of the assistance given. The Department of Public Welfare maintains two hostels and one welfare centre to care for unemployable single homeless men without municipal domicile.

The Province of British Columbia, through the Department of Social Welfare, reimburses the municipalities on a pooled basis for 90 p.c. of the total cost of social assistance to needy persons. Also, the province shares equally with the municipalities expenditures on salaries of social workers; a municipality with fewer than 15,000 population may arrange to have the Department undertake social work within the municipality and reimburse the Department at the rate of 30 cents per capita per year.

Care of the Aged.—Homes for the aged under provincial, municipal or voluntary auspices are provided for the aged and infirm in all provinces. Voluntary homes generally are provincially inspected in accordance with prescribed standards and in some provinces must be licensed. Most provinces contribute to the maintenance of elderly persons in homes for the aged either through general assistance or through statutes which relate particularly to these homes. Also, as previously indicated, 50 p.c. of the payments on behalf of assistance cases in homes for the aged and infirm (homes for special care) are met by the Federal Government.

Several provinces make capital grants towards the construction of homes, and in four provinces capital grants are also available to municipalities, voluntary organizations, or limited-dividend companies for the construction of low-rental housing.

Newfoundland maintains a Home for the Aged and Infirm at St. John's and also pays, in whole or in part, the cost of maintaining needy old people in homes for the aged and boarding homes. In 1955, a grant of 20 p.c. of costs, to be paid over a ten-year period, was made to a religious organization for the construction of a home, and provision is made for grants to similar projects under other auspices. The aged and infirm in Prince Edward Island are cared for in Falconwood Mental Hospital and in two provincial infirmaries. In Nova Scotia, the aged are cared for in municipal or county homes, in homes operated by religious or private organizations and in private boarding homes. The province reimburses the municipalities for two-thirds of their expenditures for the maintenance of needy persons in municipal homes, subject to compliance with specified standards of care and accommodation. Homes for the aged receiving aid from the provincial government are subject to provincial inspection. Homes for the aged in New Brunswick are operated under municipal, religious, fraternal and private auspices, and receive no direct financial support from the province. Voluntary and proprietary homes are now subject to provincial licensing and inspection and must meet standards contained in regulations under the Health Act.

Institutional care for indigent old people in Quebec is provided through charitable institutions under the Public Charities Act. The Homes for the Aged Act authorizes the province to erect and maintain homes for the aged and housing projects, or to make grants to voluntary organizations for this purpose. Standards in homes are governed by regulations under the Public Health Act.

Under the Ontario Homes for the Aged Act, municipalities must provide institutional or boarding home care for the aged. The province contributes 50 p.c. of the costs of constructing approved homes and 70 p.c. of their net operating and maintenance costs. It also pays up to 70 p.c. of the costs of maintenance in approved boarding homes. Homes for the aged under voluntary auspices are approved, inspected and assisted under the Charitable Institutions Act, which provides for grants in aid of construction equalling 50 p.c. of costs up to \$2,500 per bed and maintenance grants of 75 p.c. of the amount spent by the organization up to \$3.40 per day for each resident. The Elderly Persons Housing Aid Act provides for grants to limited-dividend housing corporations building low-rental housing for elderly persons.

Institutions and boarding homes for the aged and infirm in Manitoba are supervised and licensed by the Department of Health and Public Welfare under public health legislation. Under the Elderly Persons Housing Act, the province makes construction grants to municipalities and charitable organizations, equalling one-third of the costs of constructing or acquiring and renovating housing accommodation and homes for the aged. Grants may not exceed \$1,400 and \$1,667 for one-person and two-person housing units, respectively; \$1,200 per bed for new homes for the aged; and \$700 per bed for homes that have been renovated. Under the Social Allowances Act, 1959, the entire cost of assistance to those who, because of age or incapacity, require care by another or in a home for the aged for more than 90 days is borne by the province.

Aged and infirm persons in Saskatchewan are cared for in four provincial nursing homes and in voluntary homes for the aged. The latter are inspected and licensed under the Housing Act. This Act also empowers the province and municipalities to subscribe to the stock of limited-dividend housing companies building low-rental accommodation for older persons; the province may also make loans to municipalities to assist them in subscribing. Capital grants amounting to 20 p.c. of construction costs and maintenance grants equalling \$40 per bed per year may be made to municipalities, churches or charitable organizations sponsoring approved homes or housing projects. Costs of maintaining needy persons in homes for the aged are shared by the province and the municipalities under the Social Assistance Act.

Under what are termed "master agreements", the Province of Alberta bears the cost of constructing and equipping homes for the aged and housing units on municipal land. Projects are operated by provincially incorporated foundations which include municipal councilmen in their membership; net costs of operation are borne by the municipalities. The province also meets up to 80 p.c. of the cost incurred by municipalities for the maintenance of elderly persons in housing projects and municipal or private homes. Private homes are municipally licensed.

British Columbia operates the Provincial Home for Elderly Homeless Men, the Provincial Infirmary for the chronically ill and, for senile and psychotic patients, three provincial homes for the aged. It also licenses and supervises homes for the aged and boarding homes and, where necessary, shares with the municipalities on a 90-10 basis the cost of maintaining needy residents. Under the Elderly Persons Housing Aid Act the province makes grants amounting to one-third of construction costs to municipalities and non-profit corporations, including religious and service organizations, engaged in building homes or low-rental housing units for elderly citizens.

Child Care and Protection.—Child welfare services, which include child protection and care, services for unmarried parents, and adoption services, are provided in all provinces under provincial legislation and are administered by some central authority, usually a division of child welfare within the department of welfare. Except in Quebec, where the province does not administer services directly, the program may be administered by the provincial authority itself or the responsibility may be delegated under provincial child welfare Acts to local children's aid societies, that is, to voluntary agencies with boards of directors, operating under charter and under the general supervision of provincial departments. In Quebec, child welfare services are administered by recognized voluntary

agencies and institutions, religious and secular. In Newfoundland, Prince Edward Island, Saskatchewan and to a large extent in Alberta, they are administered by the province; in the larger urban centres of Alberta there is some delegation of authority to the municipality. In Ontario and New Brunswick, a network of local children's aid societies, operating under statutory authority, is responsible for the services. In Nova Scotia, Manitoba and British Columbia, services are administered by local children's aid societies in the heavily populated areas and by the province in other areas.

Children's aid societies and the recognized agencies in Quebec receive substantial provincial grants and sometimes municipal grants and in many areas they also receive support from private subscriptions or from community chests or united funds. Maintenance costs for children in care of a voluntary or public agency may be borne entirely by the province—as in Alberta, Manitoba, Prince Edward Island and Newfoundland—or partly by the municipality of residence and partly by the province.

The child welfare agencies, whether provincial offices or authorized private agencies, have the authority to investigate cases of alleged neglect and, if necessary, to apprehend a child and to bring the case before a judge upon whom rests the responsibility of deciding whether in fact the child is neglected. When neglect is proved, the court may direct that the child be returned to his parent or parents, under supervision, or be made a ward of the province or a children's aid society or, in Quebec, be placed under the authority of a suitable person or agency. The appropriate agency is then responsible for making arrangements to meet the needs of the child in so far as community resources permit. The services may involve casework with families in their own homes, or care may be provided in foster boarding homes, in adoption homes or, for children who need this form of care, in selected institutions. Children placed for adoption may be wards or they may be placed on the written consent of the parent. Special efforts, which are meeting with considerable success, are being made to find suitable homes for children found difficult to place for adoption because of age, disability or ethnic differences. Adoptions, including those arranged privately, number about 10,000 annually.

Child welfare agencies make use of the small selective institution for placement of children who are forced to be away from their own homes for a short period or who may need preparation for placement in foster homes, and also for teen-age children who may find it easier to fit into a group setting than into a foster home. A growing number of institutions are meeting this demand for special care by a reduction in size or reorganization into small units and by the introduction of training courses for staff and other measures for the improvement of standards. The development of small, highly specialized institutions, which function as treatment centres for emotionally disturbed children, has been of particular significance in recent years.

Institutions for children are governed by provincial child welfare legislation or by special statutes dealing with welfare institutions, and by provincial or municipal public health regulations. The institutions are generally subject to inspection and in some provinces to licensing, and are usually required to make reports to the province on the movement of children under their care. Sources of income may include private subscription, provincial grants, and maintenance payments on behalf of children in care, payable by the parents, the placing agency, or the responsible municipal or provincial department.

Services to unmarried parents include casework services to the mother and possibly to the father, legal assistance in obtaining support for the child from the father, and foster-home care or adoption services for the child. If necessary, support for unmarried mothers may be obtained under general assistance programs. In many centres, homes for unmarried mothers are operated under private or religious auspices.

Except in Ontario, day nurseries for the children of working mothers have been established only in the larger centres; these are under voluntary auspices and in four provinces subject to licensing. In Ontario, where municipal day nurseries have been established in most of the industrial centres, a Day Nurseries Act sets out standards for operation and licensing to be met by all agencies offering day-care services. It also provides for reimbursement of one-half of the operating and maintenance costs of municipal day nurseries.

Subsection 3.—Workmen's Compensation

In all ten provinces, legislation is in force providing for compensation for injury to a workman by accident arising out of and in the course of employment or by a specified industrial disease. A summary of provincial workmen's compensation legislation is given in Chapter XVII.

PART III.—NATIONAL VOLUNTARY HEALTH AND WELFARE ACTIVITIES

A number of national voluntary agencies carry on important work in the provision of health and welfare services, planning and education. These agencies, some of which are described below, supplement the services of the federal and provincial authorities in many fields and play a leading role in stimulating public awareness of health and welfare needs and in promoting action to meet them.

The Canadian Welfare Council.—The Council, established in 1920, is a national voluntary association of organizations and individual citizens whose aim is to further the advancement of social welfare in Canada. Member organizations include community funds and councils, other private social agencies, various federal, provincial and municipal departments, and citizen groups and individuals active in the fields of health, welfare and recreation. It furnishes authoritative information, technical consultation and field service in the main areas of social welfare and provides a means of co-operative planning and action by public and private agencies.

The policies and programs of the Council are determined by its members under the leadership of a nationally representative board of governors. Aided by professional staff, the members work together through Divisions of Family and Child Welfare, Public Welfare, Corrections, and Community Funds and Councils, and through special committees on such subjects as welfare of immigrants and the aging. Departments of the Council include the Information and Research Branches and French Speaking Services. The Council publishes periodicals entitled *Canadian Welfare* and *Bien-Être Social Canadien*, a directory of Canadian welfare services, pamphlets, and division bulletins.

The Canadian Diabetic Association.—Formed in 1953 with headquarters in Toronto, the Association has approximately 20 branches in various parts of the country and a French-language affiliate, Association du Diabète, in Quebec. The aim of the organization is to promote public education regarding diabetes and to assist diabetic sufferers. Several provincial branches operate summer camps for diabetic children and the Ontario branch provides a diet-counselling service.

The Canadian Red Cross Society.—Established in 1896 in Canada, the Society is affiliated with the International Red Cross and has branches in all ten provinces with a national headquarters in Toronto. Its objectives, defined in its Charter, are "... in time of peace or war to carry on and assist in work for the improvement of health, the prevention of disease and the mitigation of suffering throughout the world". Red Cross Society activities are very broad, ranging from national and international disaster relief services to the support of local projects. One of the major activities in Canada is the operation of a national blood transfusion service, which includes collecting and supplying free of charge, for hospital use, blood provided by voluntary donors. The Society also maintains outpost hospitals, nursing stations and emergency units in several provinces. The Junior Red Cross promotes health education through its schoolroom branches across Canada; it supports a special fund to supply treatment to indigent handicapped children in Canada and a fund to promote understanding among school children of different countries.

The Canadian Foundation for Poliomyelitis and Rehabilitation.—The Canadian Foundation for Poliomyelitis was formed in 1948 to assist victims of poliomyelitis. Recently, however, because of the protection afforded by Salk vaccine, the Foundation has broadened its aims and changed its name to the Canadian Foundation for Poliomyelitis and Rehabilitation. Provincial chapters in all ten provinces conduct an annual March of Dimes campaign to raise funds for the support of various rehabilitation projects; these include financial support to treatment centres for the disabled and direct services such as assistance in meeting the costs of medical and related services for needy disabled persons; in some provinces direct services are confined to those for adults. The Foundation, particularly in 1959, has also given support to the operation of clinics for immunization against poliomyelitis.

Victorian Order of Nurses.*—Since its inception in 1897, the Victorian Order of Nurses has provided a professional home nursing and health counselling service. In all provinces except Prince Edward Island, the association's nurses carry out bedside nursing, prenatal, postnatal and newborn care. In some provinces they also assist provincial health authorities in tuberculosis and venereal disease programs and conduct child health clinics. In 1958 the Order employed 642 nurses to serve in 120 branches located in nine provinces. The national office is in Ottawa.

The Canadian National Institute for the Blind.—Since its inception in 1918 the Canadian National Institute for the Blind has been dedicated to the provision of rehabilitation and social welfare services to the blind and to those with partial sight. The national office, located in Toronto, serves all provinces through its seven regional divisions and 46 branches. The Institute provides both social services and financial assistance; it arranges for examinations and eye treatment services, purchases glasses for needy persons and, in co-operation with hospitals and medical centres, operates an eye-bank. Under an extensive rehabilitation program with training facilities centred in Toronto, it trains blind persons in various occupations, offers job counselling and placement services and, for those who cannot compete in industry, it provides sheltered workshops; more than 425 newspaper, tobacco and confectionery concession stands are operated by blind persons. Sightless field workers bring a home-training program to blind persons to help them learn Braille, typing and handicrafts, and a special program for pre-school blind children prepares them for attendance at a school for the blind. The Institute builds and maintains residential quarters and recreational facilities in all larger centres and supplies Braille books and recordings to the blind from its national library in Toronto.

The Health League of Canada.—The Health League of Canada, first established in 1918 as a National Committee for Combating Venereal Disease, now embraces about 60 national member associations supporting a wide variety of health activities. The primary objectives of the League are the promotion of personal and community health and the prevention of disease through health education. Its major activities are administered from a national office in Toronto, usually working through the affiliated organizations. Educational efforts include the provision of speakers for meetings and the preparation of radio scripts, health education films and literature; a magazine is published bi-monthly and weekly news bulletins are released to the press. The League also sponsors a National Health Week and a National Immunization Week.

St. John Ambulance Association.—The Order of the Hospital of St. John of Jerusalem began as a local unit in Montreal in 1884. The organization is composed of two parts—the St. John Ambulance Association and the St. John Ambulance Brigade. The first is devoted to teaching first aid and home nursing and the latter to directing the emergency corps of trained personnel. Headquarters of the Association is in Ottawa, with provincial divisions in all provinces controlling their own programs and financing the operation of their local branches.

* Details of the home nursing services of the Order are given in the 1957-58 Year Book, pp. 269-270.

The Canadian Tuberculosis Association.—Founded in 1900 to stimulate public demand for increased treatment facilities, the Association has extended its objectives to case-finding, diagnostic services, rehabilitation of ex-patients and public education. Close co-operation exists with departments of health in the areas of case-finding and rehabilitation. Provincial organizations, which exist in all provinces, are largely autonomous, with the national office in Ottawa acting as a co-ordinating agency for the distribution of publicity material and as an advisory body to government agencies as well as to the provincial and local branches. The Association and its provincial bodies are supported by the sale of Christmas seals, with federal and provincial governments providing grants for specific projects.

The National Cancer Institute of Canada.—The National Cancer Institute, composed of persons representing professional societies and agencies concerned with cancer research and therapy, was founded in 1947 to develop a nationally co-ordinated research and professional education program. The Institute promotes fundamental research through selected projects in universities, hospitals and research centres, maintains a Canadian Tumour Registry, provides training fellowships and, in co-operation with the Canadian Medical Association and medical schools, promotes professional education on cancer topics. The Institute receives support from federal and provincial grants and from the Canadian Cancer Society; a special project on lung cancer has been supported by the Canadian Tobacco Industry.

The Canadian Hearing Society.—Organized in Toronto in 1940 as the National Society of the Deaf and the Hard of Hearing, the Society operates chiefly in Toronto and the surrounding area. It is concerned with the preservation of hearing, the treatment of deafness and the provision of rehabilitation services for those with impaired hearing. It provides otological examinations, counselling, vocational guidance and job placement services for the deaf or hard-of-hearing, and hearing aids to indigent persons.

The Canadian Mental Health Association.—The Association, organized in 1918 as the National Committee for Mental Hygiene, now has divisions in nine provinces. Since its inception the organization has participated directly or indirectly in almost every development in the mental health field in Canada. The Association conducts an active public education program, serves as consultant to government departments, welfare agencies and voluntary organizations, operates a teacher-training program and encourages research. Volunteer workers provide a variety of services related to the welfare of discharged and hospitalized mental patients. The national office at Toronto is supported by voluntary donations and federal and provincial grants.

The Canadian Cancer Society.—Organized in 1938 to co-ordinate voluntary activities and disseminate knowledge in the cancer field, the Canadian Cancer Society operates in all provinces and has its national office in Toronto. Its services include a public education program, welfare services such as transportation, home nursing and cancer dressings to needy persons, and fellowships to medical graduates for advanced study in cancer. Voluntary subscriptions to the Society provide the major source of funds for the basic research program of the National Cancer Institute of Canada. The Society also supports clinical research.

National Heart Foundation of Canada.—The Canadian Heart Foundation, formed in 1947 by physicians to co-ordinate research and disseminate information, was replaced by the National Heart Foundation of Canada in 1956. Its membership consists of lay and medical organizations interested in promoting or assisting research on cardiovascular diseases. Support for research projects comes from national and provincial grants and from private donations. The Foundation's national office is in Toronto; provincial branches have been established in eight provinces.

The Canadian Paraplegic Association.—The Canadian Paraplegic Association, which was established in 1945 to complement the specialized treatment and rehabilitation services developed for veterans by the Department of Veterans Affairs, now includes services for civilian paraplegic cases and persons seriously handicapped by poliomyelitis and other disabling conditions. The national office of the Association and the major treatment centre, Lyndhurst Lodge, are housed in the same building in Toronto. Services include in-patient and out-patient therapy, the provision of prosthetic appliances, loans to patients, and rehabilitation services such as job counselling. Four regional divisions also have been established. The British Columbia Division is affiliated with the G. F. Strong Rehabilitation Centre in Vancouver.

The Canadian Council for Crippled Children and Adults.—The Council was established in 1937 to co-ordinate and support activities for the care and rehabilitation of physically impaired children. The first provincial organization was formed in Ontario in 1922 and similar organizations, which have remained autonomous, now exist in all provinces. In 1954 the services of the organization were extended to include adults. Programs in the provinces vary, ranging from the establishment of cerebral palsy clinics and the operation of summer camps for the handicapped, to payment for treatment services, prosthetics, and hospital and nursing care for needy handicapped persons. In most provinces, service clubs raise funds to support the work of the organization, particularly through the sale of Easter Seals.

The Canadian Arthritis and Rheumatism Society.—Established in 1948 to promote research, professional education and treatment services in the field of rheumatism and arthritis and to disseminate factual information, the Society has branches operating in all provinces except Prince Edward Island and Newfoundland; its national office is in Toronto. Medical advisory boards in each of the eight provinces and one at the national level give advice and guidance to the provincial and national directors. The Society sponsors an education program both for the general public and for physicians and maintains out-patient clinics in general hospitals for the treatment of low-income patients. Its branches pioneered in the operation of mobile clinics and now operate some 70 units to bring treatment to home-bound patients and in three provinces support a mobile consultative service. All divisions have liaison with employment agencies and vocational training schemes. Services are usually free or for a nominal amount. The national body promotes research projects in various universities and institutions and provides clinical fellowships to physicians in all parts of Canada.

Multiple Sclerosis Society of Canada.—Organized in 1948 to encourage, support and co-ordinate research regarding multiple sclerosis, the Society also compiles statistics and carries on public education. The national office in Ottawa is maintained by 19 provincial and local chapters whose chief function is fund raising from which research projects are financed. Local chapters also help indigent persons to obtain wheel chairs, orthopaedic supports and other necessary equipment.

The Canadian Association for Retarded Children.—The Association was incorporated in 1958 to assist and give co-ordinated direction to the work of a growing number of organizations for the mentally retarded, now represented by 10 provincial and some 130 local groups. Membership of the locals exceeds 12,000, most of whom are parents of mentally retarded children. The Association promotes the establishment of clinics, day schools, institutions and workshops; it also supports and encourages research into the causes of mental deficiency. Increasing numbers of day classes offer training opportunities within the community for mentally retarded children who are not acceptable for regular school instruction. Financial support comes from local fund-raising campaigns, community chests, and, in varying degrees, from provincial departments of education.

The Muscular Dystrophy Association of Canada.—This Association was organized in 1954 to stimulate and unify efforts in research into the cause, nature and cure of muscular dystrophy and to promote the establishment of facilities for diagnostic, consul-

tative and treatment services. It has a national office in Toronto supported by nine regional chapters and its chief activity is the support of research projects in medical centres across the country. Assistance is given to individuals suffering from muscular dystrophy through the purchase of necessary equipment and the provision of transportation to clinics.

PART IV.—VETERANS SERVICES*

The Department of Veterans Affairs administers most of the legislation making up the Veterans Charter and provides administration facilities for the Canadian Pension Commission which administers the Pension Act and the Civilian War Pensions and Allowances Act; for the War Veterans Allowance Board which is responsible for the administration of the War Veterans Allowance Act; and for the Secretary-General (Canada) of the Commonwealth War Graves Commission.

The main benefits now provided to veterans consist of medical treatment for those eligible to receive it, land settlement and home construction assistance, educational assistance for children of the war dead, veterans insurance, general welfare services, unused re-establishment credit, disability and widows' pensions, and war veterans allowances.

The work of the Department, excepting the administration of the Veterans' Land Act, is carried out through 17 district offices and five sub-district offices in Canada and one district office in England. There are eight Veterans' Land Act district offices and 13 regional offices established to administer the benefits of that Act.

Section 1.—Medical, Dental and Prosthetic Services

Medical Services.—The Department of Veterans Affairs, through its Treatment Services Branch, provides medical services for eligible veterans across Canada. Service is also provided for members of the Armed Forces, the Royal Canadian Mounted Police, and the wards of other governments or departments at the request and expense of the authorities concerned.

The primary responsibility of the Branch is to provide examination and treatment to disability pensioners for their pensionable disabilities. These veterans constitute about one-quarter of the in-patient load. The pensioner receives treatment regardless of his place of residence, but service to other veterans is available in Canada only.

Other main groups of veterans receiving treatment are War Veterans Allowance recipients, veterans whose service and need make them eligible for domiciliary care, and veterans whose service and financial circumstances render them eligible for free treatment, or at a cost adjusted to their ability to pay. If beds are available, any veteran may receive treatment in a departmental hospital on a guarantee of payment of the cost of treatment.

Treatment is provided across Canada in 11 active treatment hospitals, two convalescent centres, and two homes maintained for the provision of domiciliary care. The rated capacity of these institutions at Mar. 31, 1960 was 8,970 beds. An additional 584 beds were available in veterans pavilions situated at Ottawa, Regina and Edmonton. Pavilions are owned by the Department but are operated by the parent hospital, and medical staff is provided by the Department. Where departmental facilities are not available, the eligible veteran may receive treatment at the expense of the Department in the hospital of his choice by his own doctor. Professional staffs of active treatment hospitals are employed on a part-time basis; in the main they are recommended for appointment by the Deans of Medicine of the universities with which the hospitals are affiliated. The majority are members of medical faculties, engaged in teaching and private practice.

The Department maintains research and medical teaching programs in its institutions which are considered essential to attract highly qualified professional men and thus ensure the veteran of the highest quality of medical care. All active treatment hospitals have been approved by the Royal College of Physicians and Surgeons of Canada for postgraduate

* Prepared by the Department of Veterans Affairs, Ottawa.

teaching in medicine and surgery, and the majority are approved also for advanced post-graduate training in the various specialties. An intern-resident program is in effect; at the end of March 1960, 272 residents and interns were in training, together with 194 interns in occupational therapy, physiotherapy, psychology, laboratory, and medical social services.

During the fiscal year 1959-60 about 90 projects were in progress in the Clinical Research Program. The program is varied but in the main deals with conditions affecting aging, which the Department is in a unique position to investigate. Self-contained Clinical Investigation Units have been set up in active treatment hospitals located at Montreal, Toronto, London, Winnipeg and Vancouver.

During the year ended Mar. 31, 1960, 26 departmental employees attended courses assisted fully or partly by the research and education vote. At the end of the year, one school for nursing assistants remained in operation. This school, at Camp Hill Hospital in Halifax, has an annual capacity of 70 graduates who are offered employment in departmental hospitals across Canada.

Departmental hospitals provide base hospital facilities for the treatment of members of the Armed Forces. The Ste. Foy Hospital near Quebec City and Sunnybrook Hospital at Toronto have self-contained units but in other institutions there is a close integration of patients. The units are staffed by Armed Service personnel and utilize the ancillary services of the hospital. They also provide training facilities for members of the medical services of the Armed Forces.

Progress continues to be made toward the provision of a nation-wide chain of modern fire-resistant institutions through replacement of obsolete accommodation. Patient-load for the year ended Mar. 31, 1960, was as follows:—

<i>Item</i>	<i>No.</i>
Patients in departmental hospitals at Mar. 31.....	7,705
Patients in other hospitals at Mar. 31.....	2,312
Out-patients on strength at Mar. 31.....	427
TOTAL PATIENTS AT MAR. 31.....	10,444
Admissions to departmental hospitals during year.....	52,375
Admissions to other hospitals during year.....	20,614
Admissions to out-patient strength during year.....	1,924
TOTAL ADMISSIONS DURING YEAR.....	74,913
Patient-days in departmental hospitals.....	2,694,271
Patient-days in other hospitals.....	889,642 ¹
TOTAL PATIENT-DAYS.....	3,583,913

¹ Does not include any stay attributed to patients on out-patient strength.

Under the federal-provincial hospital insurance program, DVA hospitals in the participating provinces are recognized for the provision of insured services to veterans. Arrangements have been made for the payment of any necessary premiums on behalf of veterans who are in receipt of War Veterans Allowances. The Veterans Treatment Regulations remain the authority for the treatment of veterans (and others) in DVA institutions and elsewhere under departmental responsibility, regardless of whether or not the hospitalization is at the expense of the insurance plan.

Dental Services.—Dental treatment is provided for those pensioned veterans whose disability would be alleviated by such treatment, for War Veterans Allowance recipients, and for other persons whose health care is the responsibility of the Department, such as Royal Canadian Mounted Police personnel and members of the Canadian Forces. Treatment is also provided at the request of other governments.

The Department employs 37 full-time dentists, one half-time dentist and two dental consultants, specialists in their fields, on a part-time basis. Twenty-two dental clinics are maintained in departmental hospitals or centres on a full-time or part-time basis. Elsewhere, the services of private dentists on a fee-for-service basis are utilized. Training courses for dental surgeons in various specialties of dentistry have been conducted by the Department and many departmental dentists have participated in the research programs of their respective hospitals, and assisted the dental colleges by part-time lecturing.

All clinics and dental surgeons were working well up to capacity during 1959-60; 19,591 courses of treatment were given, an increase of 443 patients over 1958-59. Operations numbered 122,650, also an increase over the previous year.

Prosthetic Services.—The Department provides a complete coverage of prosthetic and orthopaedic appliances and sensory aid devices to disabled veterans and to other departments of government on a repayment basis. The primary issue is made on medical prescription. Maintenance and renewal are carried out at district centres. Service is given without expense to the eligible veteran. Twelve centres or shops are located in or adjacent to the departmental hospitals in major cities from coast to coast, and six sub-centres in smaller localities. The largest centre, located at Sunnybrook Hospital, Toronto, manufactures stock parts and is the central stores supply.

A research section is maintained for the design and testing of new materials and appliances. Among new developments now in general production are the plastic Syme's leg with a solid ankle and sponge rubber foot, the Canadian Hip Disarticulation leg, and a motorized unit designed by the National Research Council for wheel chairs for quadruplegic cases. A newly developed plastic mechanical hand, cosmetic gloves for artificial hands, and a light universal ankle brace to replace heavier types have recently been put into general production.

During the year ended Mar. 31, 1960, service was provided to approximately 77,000 patients who received 150,000 issues.

Section 2.—Rehabilitation Services

Much of the legislation designed to assist with the postwar rehabilitation of veterans has expired but, as indicated in this Section, some programs are still of significant importance. Besides administering the programs described in this Section, the Welfare Services Branch is responsible for all field work connected with War Veterans Allowances (see p. 342). It also provides a counselling and referral service to veterans and their dependants in relation to a wide variety of needs not covered by departmental legislation. This work requires close liaison with Service benevolent funds, veterans organizations, other government departments at the federal, provincial and municipal levels and a broad range of voluntary health and welfare organizations.

War Service Gratuity.—The payment of war service gratuities was discontinued after Dec. 31, 1954 for World War II veterans, except for those with overseas service who could not apply before that date as a result of unusual circumstances. The yearly amounts paid in gratuities up to the end of March 1955 are shown in the 1956 Year Book, p. 306. Those paid subsequently and the cumulative totals to Mar. 31, 1960 were:—

<i>Fiscal Year</i>	<i>World War II Veterans</i>	<i>Special Force Veterans</i>
	\$	\$
1955-56.....	30,536	16,932
1956-57.....	9,457	7,351

CUMULATIVE TOTALS TO MAR. 31, 1960.....	470,038,242	6,693,604

Re-establishment Credit.—On Mar. 31, 1960, an amount of \$16,000,000 in re-establishment credit, out of nearly \$325,000,000, had not yet been authorized on behalf of veterans entitled to it. World War II veterans have until Sept. 30, 1962, and veterans who served with the Special Force have 15 years from the date of their discharge from the Special Force, to apply for their unused credit. The amounts paid during 1958-59 and 1959-60 with cumulative totals to Mar. 31, 1960, by required purpose, are shown in Table 1.

1.—Re-establishment Credits Paid, by Required Purpose, Years Ended Mar. 31, 1959 and 1960, with Cumulative Totals

Casualty Rehabilitation.—The function of the Casualty Welfare Division is outlined in the 1956 Year Book, p. 307. At Mar. 31, 1960, there were 3,458 active cases. The total number of disabled veterans then registered with the Division was 47,850 and of these 44,392 were closed cases. Registrations during the year ended Mar. 31, 1960 numbered 1,144 and cases closed numbered 2,951.

Social Services.—The Social Services Division provides a casework service to veterans and their dependants, and a social welfare consultant service to other departmental officials dealing with welfare matters. It maintains liaison, in the interest of veterans and their dependants, with welfare departments at all levels of government and with private social and philanthropic agencies.

The Division has certain responsibilities in connection with the operation of the Assistance Fund available to war veterans allowance recipients who are in need (see below). At the request of the Department of National Defence it furnishes reports on home circumstances of Armed Forces personnel who request compassionate leave, posting or discharge. The latter service is often instrumental in providing help to those concerned through counselling and referral to community welfare services.

During the year ended Mar. 31, 1959, there were 15,291 requests for services from all sources, about the same as in the previous year; in the year ended Mar. 31, 1960 requests numbered 14,109, an 8-p.c. decrease from 1959.

Older Veterans.—Services on behalf of older veterans and their dependants involve assistance with individual employment and financial problems including those caused by age discrimination by employers, unemployment as a result of economic conditions and technological changes, health problems limiting work abilities and narrowing the range of feasible occupations, or retirement with inadequate pension income.

The World War I veteran population in Canada at Mar. 31, 1960 was approximately 250,000, all of whom were over 60 years of age, the average being 68 years. In addition, at least 12,000 World War II veterans were in this age group, a number that will increase at an accelerating rate. It is important that these older veterans, where necessary, be assisted to remain in or to return to self-supporting circumstances but, when this is not possible, that they and their dependants be assured security from other sources. To this end, the Veterans Welfare Services Branch works in close co-operation with other Federal Government departments concerned as well as with provincial and municipal agencies and private organizations. The general willingness of veterans in the older age group to engage in available employment rather than claim other benefits is shown by the fact that at Mar. 31, 1960, 9,410 World War I veterans were registered with the Employment Service of the Unemployment Insurance Commission, 404 fewer than at the same date of 1959. The decrease also indicates a somewhat more realistic attitude of employers toward the hiring of older workers who have the required qualifications. A continuing education program for the older veteran is conducted by the Branch through the Interdepartmental Committee on Older Workers sponsored by the Department of Labour. The Corps of Commissionaires in the fiscal year 1959-60 provided full-time uniformed employment for more than 5,000 selected older veterans, half of whom were working under Federal Government departmental contracts.

Assistance Fund.—Supplementary financial assistance is provided by the Assistance Fund to recipients under the War Veterans Allowance Act (see p. 342) who are in need. Assistance may be given as a continuing monthly grant in accordance with a formula which includes costs of shelter, fuel, food, clothing, personal care and certain health needs, or in single grants to meet needs not covered by the formula. The maximum assistance available from the Fund is \$240 and \$300 per annum, respectively, to single and married recipients of WVA.

Field work for the Fund is done almost entirely by the Welfare Services Branch which, through counselling and referral, also assists applicants in other ways. Since a monthly Assistance Fund Grant may be continued without interruption until there is a change in

the recipient's financial circumstances, the number of people assisted in any fiscal year is greater than the number applying during that period. Fund activity during the years ended Mar. 31, 1959 and 1960 was as follows:—

Item	Years Ended—	
	Mar. 31, 1959	Mar. 31, 1960
Persons assisted.....	No. 14,055	16,705
Persons applying during year.....	" 6,153	6,389

Proportion of expenditures given in monthly grants.....	p.c. 88	91
Persons in receipt of continuing monthly grants.....	No. 11,063	13,346

Education and Training.—Eligibility for training under the Veterans Rehabilitation Act and the Veterans Benefit Act, 1954 has lapsed except for disability pensioners and for a few special cases delayed by personal illness. Effective July 27, 1959, Pensioners Training Regulations were consolidated and now provide essential training for pensioned veterans without affecting, or being affected by, other benefits that may have been received. They also provide for training of pensioned ex-members of the regular and reserve forces.

Training activities at Mar. 31, 1959 and Mar. 31, 1960, respectively, were as follows:—

Type of Training	Mar. 31, 1959	Mar. 31, 1960
	No.	No.

TOTALS.....	147	138

The Children of War Dead (Education Assistance) Act provides help with post-secondary school training for children of deceased ex-servicemen whose deaths have been ruled by the Canadian Pension Commission to have been attributable to or incurred during war service, or attributable to regular force service. Eligible students who attend approved training institutions receive an allowance of \$25 a month if under age 21, and \$60 a month if over that age but not over 25 years of age. Prescribed fees not exceeding \$500 for any one academic year may be paid on behalf of each student. Up to Mar. 31, 1959, 1,406 applications were approved under this Act. At Mar. 31, 1960, the number had risen to 1,736.

Awaiting Returns Allowance.—This allowance is a sustenance grant designed to assist in the maintenance of the veteran and his family during the early stages of a venture when the income therefrom is negligible or insufficient for that purpose. Because of the time limit imposed under the Veterans Rehabilitation Act, only veterans who settle under the Veterans' Land Act and who apply for the allowance within one year of date of establishment thereunder are now eligible. The maximum entitlement to the benefit is 52 weeks, available within two years of the date of initial award. The allowance is payable for periods when the net income plus the allowance does not exceed the maximum rate of \$50 per month for a single veteran and \$70 per month for a married veteran plus additional allowance for up to six children and/or \$15 per month for each dependent parent.

Up to Mar. 31, 1960, 63,039 veterans, including 65 ex-members of the Special Force, were approved for the allowance, 90 p.c. of whom were discontinued as established. The total amount expended on this benefit from inception to Mar. 31, 1960 was \$27,324,131. At that date there were 94 active cases.

Vetcraft.—A short history of Vetcraft is shown in the 1959 Year Book, p. 293. Shops are now operated at Toronto and Montreal providing full-time employment for a number of veterans and widows and, in addition, small assembly work is done in Winnipeg, Regina and Calgary, providing part-time employment for other workers. Production for the year 1959, which was sold entirely to the Dominion Command of the Canadian Legion, amounted to 6,402,000 poppies and 63,879 memorial wreaths and crosses.

Section 3.—Veterans Life Insurance

Returned Soldiers' Insurance.—The Returned Soldiers' Insurance Act (SC 1920, c. 54 as amended) provided eligibility to contract for life insurance at rates comparable to those available commercially but the medical standard required of applicants was much lower than otherwise acceptable. Applications were accepted from 1920 to 1923 and from 1928 to 1933. No policies have been issued since Aug. 31, 1933.

On Mar. 31, 1960, of the total of 48,319 policies issued there remained 9,593 policies in force for a face amount of \$20,320,841. Of this number 2,429 were premium-paying, 6,434 were paid up, 113 had been converted to extended term insurance and 617 were being covered in the disability provisions of the policy contracts. Terminations from 1920 to Mar. 31, 1960 totalled 38,726. Of this number 12,835 were terminated by death, 16,960 by surrender for cash value and 8,931 by lapse, expiry or other mode of termination.

Veterans Insurance.—The Veterans Insurance Act (SC 1952, c. 279 as amended) provides eligibility to contract for life insurance to veterans of World War II and those who served in the action in Korea and certain other groups. The period of eligibility to apply for this insurance, up to a maximum of \$10,000, extends to Sept. 30, 1962.

Of the 48,661 applications received to Mar. 31, 1960, only 81 had been declined for medical reasons. Of the 46,882 policies issued, 30,336 for a face amount of \$94,521,762 remained in force on that date, 11,424 policies had been surrendered for their cash value and 2,650 policies were terminated by lapse and extended term insurance expiry. There were 2,403 policies terminated by death.

1960.....	444	861,769	290	810,742

Section 4.—Land Settlement and Home Construction

Veterans' Land Act.—This Act, which consists of three distinct Parts, provides for the settlement of veterans of World War II and the Special Force under five broad categories: farming as a full-time occupation; part-time farming in rural or semi-rural areas to supplement income from other employment; commercial fishing; land settlement, generally

in pioneer areas, under agreements between the Federal Government and the provinces; and home building on city-size lots by veterans who have been approved for a loan under the National Housing Act and who act as their own contractors.

Major amendments were made to the Act in 1959, principally relating to the amount of financial assistance available. Under Parts I and III, maximum loans to full-time farmers for the acquisition or development of economic farm units were increased from \$9,000 to \$20,000; and to part-time farmers and commercial fishermen from \$7,400 to \$9,000. The financial assistance available to veterans building their own homes on city-size lots under the provisions of Part II was increased from \$8,000 to \$10,000.

In addition to increasing the maximum of farm loans, the amendments broadened the purposes for which such loans may be made to include the purchase of basic herd livestock and necessary farm equipment, and the repayment of debts reasonably incurred by full-time farming veterans in the development of economic family-farm units. The repayment period of farm loans under Part III for full-time farmers was also extended from 25 to 30 years.

Of the maximum financial assistance available to full-time farmers, part-time farmers and commercial fishermen, \$6,000 is provided under Part I of the Act. A conditional grant or subsidy of up to \$2,320 may be earned by compliance with the terms of the contract for the first 10 years. The maximum repayment period for Part I loans is 25 years with interest at 3½ p.c. Loans made under Part III, with interest at 5 p.c., are repayable over a period of 30 years in the case of full-time farmers and over 25 years in the case of part-time farmers and commercial fishermen.

Veterans being settled on federal or provincial lands and Indian veterans being settled on Indian reserves may obtain financial assistance up to \$2,320 which is non-repayable provided settlement terms and conditions are met for a period of 10 years.

Under Part II, a qualified veteran who has been approved for a loan under the National Housing Act may receive financial and other assistance to build his own home on any lot suitable for a single-family dwelling. The maximum financial assistance available is \$10,000 which, upon completion of the home, is repayable under a mortgage contract with Central Mortgage and Housing Corporation or an approved lender under the National Housing Act at the rate of interest chargeable under that Act.

The Veterans' Land Act Branch continues to be organized into eight districts comprising 32 regional offices. However, as a result of arrangements made with the Farm Credit Corporation for the utilization of the trained VLA staff to handle work under the Farm Credit Act, a major reorganization of field areas is in progress. When completed, the unified field staff of both administrations will comprise 200 Farm Credit Advisors resident within their respective field areas who will be responsible for providing pre-loan counselling related to farm organization, farm planning, credit requirements, etc., to prospective borrowers under the Veterans' Land Act or the Farm Credit Act; carrying out appraisals of farm properties; and providing post-loan counselling for as long as may be necessary in each case.

The field organization of the Veterans' Land Act Branch will also consist of 60 Settlement Officers and 84 Construction Supervisors strategically located across the country whose main duties will relate to the establishment and supervision of part-time farmers and veterans building their own homes.

At the end of March 1960, 83,884 veterans had received financial assistance under the various types of settlement provided in the Veterans' Land Act and a total of \$455,297,926 had been expended. Active accounts numbered 54,682, including 631 Indian veterans settled on Indian reserves whose accounts are administered by the Department of Citizenship and Immigration. During 1959-60, approvals for assistance were made on behalf of 2,910 veterans of World War II and the Special Force, including 350 for full-time farming, 1,837 for part-time farming, 40 for commercial fishing, 21 for settlement on Indian reserves, and 662 for home building on city-size lots under Part II. There

were also 941 additional loans made to established full-time farmers under the provisions of Part III. All of these approvals involved the expenditure of more than \$24,700,000 in public funds during the year.

To Mar. 31, 1960, a total of 26,453 houses had been completed and a further 1,337 were under construction. There were 1,533 houses completed in 1959-60, a further 1,436 new houses were started and 1,096 veterans received approval to effect additions or improvements to their houses and other buildings.

During 1959-60 a total of 4,679 appraisals were carried out, including 1,055 relating to applications for additional loans under Part III from full-time farming veterans already settled. Also included were 720 appraisals made for other government departments or agencies, many of them involving properties of substantial value. Since inception of operations under the Act, VLA field staff have made more than 110,000 appraisals.

The repayment record of the settled veterans continues to be very satisfactory, as evidenced by the fact that, on Mar. 31, 1960, less than 2 p.c. of the active accounts, on an annual or semi-annual payment basis, had arrears in excess of \$200, or \$100 if paying monthly. The total amount returned to the Treasury from current active accounts represents 105.9 p.c. of the total amount due and owing in such accounts. Of the \$419,000,000 expended on behalf of 74,040 veterans established with repayable contracts in 16½ years of settlement operations to Mar. 31, 1960, approximately 55 p.c. had been repaid. Included in this percentage was the amount of \$51,592,000 constituting conditional grants earned by 32,110 veterans who have fulfilled the terms of settlement for the first ten years of their contracts.

One of the factors contributing to the very favourable repayment record of the VLA settlers is the fact that 23,672 adopted one of the various pre-arranged repayment plans made available to them. There are 16,391 using the post-dated cheque plan, 6,354 have given orders on pensions or have made salary assignments and, at the end of March 1960, there were 927 share-of-crop agreements in effect in the spring wheat areas of the Prairie Provinces. In addition, 1,931 veterans have completely repaid their contract debts and have only to fulfil the residence or personal operation requirements of their agreements for the remainder of their 10-year conditional grant periods in order to acquire title.

4.—Summary of Settlement and Expenditures under the Veterans' Land Act, as at Mar. 31, 1960

NOTE.—This table does not include details relative to sales of reverted or surplus property to civilian purchasers.

Section 5.—Pensions Advocates

Veterans Bureau.—The Veterans Bureau, which has completed its twenty-eighth year of operation, is a branch of the Department of Veterans Affairs and has an office under the direction of a District Pensions Advocate in all districts in Canada in which offices of the Department are situated and at the District Office in London, England.

The duties of Pensions Advocates, most of whom are lawyers, are to assist former members of the Armed Forces and their dependants and former members of the various auxiliary organizations, such as merchant seamen, firefighters and others, in preparing and submitting claims to the Canadian Pension Commission. They also appear as counsel for applicants before the Appeal Boards of the Commission. No charge is made for the services of the Bureau.

During the year ended Mar. 31, 1960, 6,520 claims were submitted to the Pension Commission. This figure represents a slight increase over the 6,100 claims submitted during the previous fiscal year.

Section 6.—Veterans Pensions

Previous issues of the Year Book contain information on the development of Canadian pension legislation, together with yearly statistics of numbers and liabilities. The Pension Act has not been amended since 1957. The major amendments at that time which resulted in increased benefits are summarized in the 1959 Year Book, p. 297.

The annual rates for a 100-p.c. disability for all ranks up to and including that of Lieutenant-Colonel and equivalent ranks are:—

	\$
Pensioner.....	1,800
Wife.....	600
First child.....	240
Second child.....	180
Each subsequent child.....	144

For assessments lower than 100 p.c., the awards are proportionately less. The rate of personal pension is slightly higher if the pensioner held the rank of Colonel or higher rank but the additional pension for wives and children remains the same for all ranks.

Attendance allowance, which is payable to a pensioner who is totally disabled and in need of attendance, and which varies from a minimum of \$480 to a maximum of \$1,800 depending on the amount of attendance required, is paid in addition to pension. While a pensioner must be totally disabled to receive this allowance, the disability resulting in the need of attendance may be non-pensionable.

The annual rates of pension for widows and children of all ranks up to and including that of Lieutenant-Colonel and equivalent ranks are:—

	\$
Widow.....	1,380
First child.....	480
Second child.....	360
Each subsequent child.....	288

Rates for widows are slightly higher if the deceased veteran held the rank of Colonel or higher rank but those for children remain the same for all ranks.

The Civilian War Pensions and Allowance Act provides for the payment of pensions to, or on behalf of, persons who served in certain civilian groups that were closely associated with the World War II effort, and who suffered injury or death as a result of such service. These groups include merchant seamen, saltwater fishermen, auxiliary services personnel, ferry pilots of the RAF Transport Command, firefighters who served in the United Kingdom, etc.

6.—Pensions in Force at Mar. 31, 1960

Service	Disability		Dependant		Disability and Dependant	
	Pensions in Force	Liability	Pensions in Force	Liability	Pensions in Force	Liability
	No.	\$	No.	\$	No.	\$
World War I.....	47,845	37,450,089	14,812	19,566,585	62,657	57,016,674
World War II.....	104,911	68,546,893	17,546	19,336,214	122,457	87,883,107
Special Force.....	1,607	898,183	171	213,463	1,778	1,111,646
Regular Force.....	1,249	667,956	485	755,987	1,734	1,423,943
Totals	155,612	107,563,121	33,014	39,872,249	188,626	147,435,370

Section 7.—War Veterans Allowances

War Veterans Allowances were first introduced in 1930 for those veterans who, as a result of their front-line service, were considered to have been pre-aged and therefore were at a disadvantage in the labour market before their time. Since then the War Veterans Allowance Act has been revised and amended on numerous occasions; each time its scope has been extended or its provisions made more generous.

The last legislative changes occurred in 1957. Effective July 1, 1957, Parliament approved certain increases in the rates of allowance payable and income ceilings. Additional changes became effective Nov. 1, 1957, including further increases in the rates of allowances and income ceilings; a change in the requirement of 20 years residence in Canada to 10 years for veterans of Commonwealth and Allied Forces; and eligibility established, from a service standpoint, for Canadian veterans who served in England during World War I for at least 365 days prior to Nov. 12, 1918.

As the Act now stands, War Veterans Allowances are payable, in Canada only, to Canadian veterans of the Northwest Field Force, the South African War, World Wars I and II, and the Korean operation; to veterans of Commonwealth and Allied Forces who were domiciled in Canada at time of enlistment, or alternatively, served during any such war concluded on or before Aug. 31, 1921, and have resided in Canada for a total period of at least 10 years. An allowance may also be payable to widows or orphans of eligible veterans. To be eligible, a veteran must have served in a theatre of actual war and, if not, he must be in receipt of a pension for disability incurred on or aggravated by service or have accepted a final payment in lieu of pension of 5 p.c. or more. Other Canadian and Allied Dual Service veterans who were members of Her Majesty's Canadian Forces during World War II, who did not serve in a theatre of actual war and who are non-pensioners but who served in both World War I and World War II and were honourably discharged from both periods of service, are also eligible.

Male veterans become eligible for allowances at age 60 and female veterans or widows of veterans at age 55. Persons in both groups, however, may be awarded allowances earlier if their physical or mental condition prevents them from maintaining themselves. The allowances are paid subject to certain financial limitations, that is, the sum of income from other sources plus the allowance may not exceed a permissible annual income. Income from other sources does not include casual earnings or other specific income exempt by statute.

The rates of allowances payable and the income ceilings in effect at Mar. 31, 1960 were as follows:—

<i>Recipient</i>	<i>Monthly Maximum Allowance</i>	<i>Annual Income Ceiling</i>
	<i>\$</i>	<i>\$</i>
Veterans and widow(er)s, single status.....	70	1,080
Veterans and widow(er)s, married status.....	120	1,740
Veterans with blind spouse.....	120	1,860
One orphan.....	40	720
Two orphans of one veteran.....	70	1,200
Three or more orphans of one veteran.....	85	1,440

The numbers of veterans and others in receipt of allowances at the close of each of the fiscal years 1956-60, together with the amounts of allowances paid, were as follows:—

<i>As at Mar. 31—</i>	<i>Veterans in Receipt of Allowances</i>	<i>Others in Receipt of Allowances</i>	<i>Total in Receipt of Allowances</i>	<i>Expenditure</i>
	<i>No.</i>	<i>No.</i>	<i>No.</i>	<i>\$</i>
1956.....	37,927	14,260	52,187	39,074,156
1957.....	39,691	15,502	55,193	41,259,185
1958.....	42,705	17,242	59,947	47,990,169
1959.....	45,859	19,045	64,904	54,870,742
1960.....	47,378	20,480	67,858	57,337,891

During the year ended Mar. 31, 1960, 65,164 cases were reviewed by the 18 District Authorities across Canada so that changes in the financial, physical or domestic circumstances of the recipients concerned might be reflected in the allowance being paid. Over the same period the War Veterans Allowance Board at Ottawa (see p. 344) reviewed 24,287 cases to ensure uniformity in the application of the provisions of the legislation in all districts. During the year, 586 appeals from adjudications were dealt with by the War Veterans Allowance Board, 58 being allowed and 528 disallowed.

Section 8.—Veterans Commissions and Boards

Canadian Pension Commission.—The Canadian Pension Commission is a statutory body charged with the administration of the Pension Act and the Civilian War Pensions and Allowances Act. The members of the Commission are appointed by the Governor in Council who may also impose upon the Commission duties in respect of any grants in the nature of pensions, etc., made under any statute other than the Pension Act. The Commission reports to Parliament through the Minister of Veterans Affairs.

It is the responsibility of the Commission to adjudicate on claims for injury or disease resulting in disability or death incurred during service with the Canadian Navy, Army or Air Force during wartime or peacetime. The Commission may also supplement certain awards of pension made by the British or Allied Governments (see 1956 Year Book, p. 304).

The Commission's representatives, called Pension Medical Examiners, are located in most of the district offices of the Department of Veterans Affairs across the country.

War Veterans Allowance Board.—The War Veterans Allowance Board is a statutory body responsible for the administration of the War Veterans Allowance Act. The members are appointed by the Governor in Council and the Board reports to Parliament through the Minister of Veterans Affairs.

The administration of the Act has been almost completely decentralized through 18 District Authorities located in the district offices of the Department of Veterans Affairs across Canada. These Authorities make the initial decisions on War Veterans Allowance applications and arrange for the necessary investigations to be made by officers of the Veterans Welfare Services Branch of the Department.

The Board, which is located in Ottawa, defines policy, standardizes administrative procedures and reviews decisions of the District Authorities, either to adjudicate appeals from decisions of the Authorities or to assure the consistent administration of the Act throughout Canada.

Commonwealth War Graves Commission.—All Commonwealth Governments are members of the Commission, incorporated by Royal Charter in 1917, and are represented by their High Commissioners in London. The present title of the Commission, formerly known as the Imperial War Graves Commission, was adopted on Apr. 1, 1960 following the granting of a supplemental Royal Charter.

The Commission is entrusted with the marking and maintenance, in perpetuity, of the graves of those of the British Empire and Commonwealth Armed Forces who lost their lives between Aug. 4, 1914 and Aug. 31, 1921, and between Sept. 3, 1939 and Dec. 31, 1947. The Commission erects memorials to commemorate those with no known grave. The Minister of Veterans Affairs is the Agent of the Commission in Canada and the office of the Secretary-General of the Canadian Agency is in the Veterans Affairs Building, Ottawa.

The area of responsibility of the Canadian Agency is the Continent of North America but it has also certain duties of inspection in Argentina, the Bahamas, Barbados, Bermuda, Brazil, British Guiana, British Honduras, Chile, Costa Rica, Cuba, Falkland Islands, French West Indies, Guatemala, Hawaiian Islands, Jamaica, Leeward Islands, Netherlands Antilles, Panama Canal Zone, Peru, Puerto Rico, Trinidad, Uruguay and Windward Islands.

In North America the Agency is responsible for about 13,000 war graves in more than 2,000 cemeteries. Approximately 3,300 servicemen of both wars, missing in operations while based in North America, are commemorated on the memorials erected at Victoria, B.C., and at Halifax, N.S.

On July 1, 1959, Her Majesty the Queen unveiled a memorial in Ottawa commemorating by name approximately 800 Commonwealth Air Forces servicemen who lost their lives in the Second World War while on operations from bases in Canada and the United States, and who have no known grave.

Section 1.—Canadian Criminal Law and Procedure†

The system under which justice is administered in a State is never rigid. To have it so would be neither expedient nor indeed possible. A judicial system must grow and adapt itself to the requirements of the people and the exact limits of the powers of different legislative bodies require continued definition.

The criminal law of Canada has as its foundation the criminal common law of England built up through the ages and consisting first of customs and usages, and later expanded by principles enunciated by generations of judges. There is no statutory declaration of the introduction of English criminal law into those parts of Canada that are now the Provinces of New Brunswick, Nova Scotia and Prince Edward Island. Its introduction there depends upon a principle of the common law itself by which English law was declared to be in force in uninhabited territory discovered and planted by British subjects, except in so far as local conditions made it inapplicable. The same may be said of Newfoundland although the colony dealt with the subject in a statute of 1837. In Quebec its reception depends upon a Royal Proclamation of 1763 and the Quebec Act of 1774. In each of the other provinces and in the Yukon and Northwest Territories the matter has been dealt with by statute.

The judicial systems of the provinces as they exist today are based upon the British North America Act of 1867. Sect. 91 of the Act provides that "The exclusive legislative authority of the Parliament of Canada extends to . . . the criminal law, except the constitution of courts of criminal jurisdiction but including the procedure in criminal matters". By Sect. 92 (14), the legislature of the province exclusively may make laws in relation to "the administration of justice in the province, including the constitution, maintenance and organization of provincial courts, both of civil and criminal jurisdiction and including procedure in civil matters in its courts". The Parliament of Canada may, however (Sect. 101), establish any additional courts for the better administration of the laws of Canada. It should be noted that the Statute of Westminster, 1931, effected important changes particularly by abrogating the Colonial Laws Validity Act, 1865 (U.K.), and confirming the right of a dominion to make laws having extraterritorial operation. Particulars of the federal judiciaries are given in Chapter II, pp. 101-102, and provincial judiciaries are dealt with briefly at pp. 102-103; more detailed information on provincial judiciaries is given in the 1954 Year Book, pp. 48-55.

* Except as otherwise credited, this Chapter has been revised in the Judicial Section, Health and Welfare Division, Dominion Bureau of Statistics.

† Prepared by the Criminal Law Section, Department of Justice, Ottawa.

At the time of Confederation each of the colonies affected had its own body of statutes relating to the criminal law. In 1869, in an endeavour to assimilate them into a uniform system applicable throughout Canada, Parliament passed a series of Acts some of which dealt with offences of special kinds and others with procedure. Most notable of the latter was the Criminal Procedure Act, but other Acts provided for the speedy trial or summary trial of indictable offences, the powers and jurisdiction of justices of the peace in summary conviction matters and otherwise, and the procedure in respect of juvenile offenders.

Codification of the criminal law through a Criminal Code Bill founded on the English draft code of 1878, Stephen's *Digest of Criminal Law*, Burbridge's *Digest of the Canadian Criminal Law*, and the relevant Canadian statutes was brought about by the Minister of Justice, Sir John Thompson, in 1892. This Bill became the Criminal Code of Canada and came into force on July 1, 1893. It must be remembered, however, that the Criminal Code was not exhaustive of the criminal law. It was still necessary to refer to English law in certain matters of procedure and it was still possible to prosecute for offences at common law. Moreover, Parliament has declared offences against certain other Acts, e.g., the Opium and Narcotic Drug Act, to be criminal offences and the same was done in the Defence of Canada Regulations and the Wartime Prices and Trade Board Regulations (neither now in force) promulgated under the authority of the War Measures Act.

It is often difficult to distinguish between 'law' and 'procedure'. Procedure may be interpreted to relate simply to the organic working of the courts but, in a wider sense, it may also affect the rights or alter the legal relations arising out of any given state of facts. For present purposes it will be useful to note that writers on jurisprudence describe law as being substantive or adjective. "Substantive law is concerned with the ends which the administration of justice seeks; procedural (adjective) law deals with the means and instruments by which these ends are to be obtained."* With reference to the criminal law the former may be taken to include the provisions concerning criminal responsibility, the definition of 'offences' and the punishment for those offences, and the latter to include provisions for enforcement, e.g., powers to search and to arrest, for the modes of trial and for the proof of facts. Broadly speaking, the Criminal Code observes the distinction although it might appear that the provisions for preventive detention of habitual criminals and criminal sexual psychopaths partake of the nature of both classes.

An examination and study of the Criminal Code was authorized by Order in Council dated Feb. 3, 1949, and the Commission assigned the task of revising the Code presented its report with a draft Bill in February 1952. After coming before successive sessions of Parliament it was finally enacted on June 15, 1954 and the new Criminal Code (SC 1953-54, c. 51) came into effect on Apr. 1, 1955. A short outline of the system that existed under the repealed Code together with the major revisions effected by the new Code is given in the 1955 Year Book, pp. 295-298.

Since the new Code came into force several amendments have been made, for the most part in relation to procedure. Among the most notable of these, as well in point of procedure as of substance, are: an amendment in 1956 providing that motions for leave to appeal to the Supreme Court of Canada in criminal cases should be heard by a quorum (at least five) of judges of that Court instead of a single judge; amendments effected by SC 1959, c. 41, providing a statutory extension of the definition of "obscenity" and making provision for seizure and condemnation of offending material without a charge necessarily being laid against any person; extensive amendments relating to the allowing of time for payment of fines; amendments dealing with offences committed in aircraft in flight over the high seas; an amendment forbidding the publication in a newspaper or broadcast of a report that any admission or confession was tendered in evidence at a preliminary inquiry or a report of the nature of such admission or confession unless the accused has been discharged, or, if the accused has been committed for trial, the trial has ended.

The Parole Act (SC 1958, c. 38), brought into force on Feb. 15, 1959, revises the parole system and provides for the establishment of a National Parole Board. (See p. 371.)

* Salmond on *Jurisprudence*, 7th Edition, p. 496.

Section 2.—Adult Offenders and Convictions

The main interest in adult criminal statistics is concerned with those persons guilty of the more serious crimes. Such offenders are fewer than those who commit summary conviction offences but, from the standpoint of the protection of society, they are more important.

Statistics of indictable crimes are based on *persons*. When a person is prosecuted at the same hearing for several offences, one of those offences is selected for tabulation. The rule followed is to select the offence for which the proceedings were carried to the furthest stage—to conviction and sentence where the prisoner was tried on several charges; where there were several convictions, the offence selected is that for which the heaviest punishment was awarded; where the final result of proceedings on two or more charges was the same, the most serious offence (as measured by the maximum penalty allowed by the law) appears in the tables. Where a person was prosecuted for one offence and convicted of another (e.g., charged with murder and convicted of manslaughter), the case appears only under the offence for which he was convicted. Statistics of summary conviction offences (p. 357) are based on *convictions*.

The figures include only cases finally determined within the year. Those not entirely disposed of within the year (e.g., tried but sentence postponed) are held over for the next year's report.

The new Criminal Code, which became law in 1954 (SC 1953-54, c. 51), necessitated the alteration of certain statistical classifications. For instance, in the classification of indictable offences regroupings were made and some items added and others dropped. Also, indictable offences under the Criminal Code were shown separately from those under federal statutes. Summary convictions were classified as offences under the Criminal Code, federal statutes, provincial statutes and municipal by-laws, and methods of trial were arranged to conform with the provisions of the new Criminal Code. Thus, any comparisons between the data for 1956, 1957 and 1958 and the data published for previous years should be made with care.

Subsection 1.—Adults Convicted of Indictable Offences

During 1958 the courts of Canada dealt with 38,415 adults charged with 69,983 indictable offences, of whom 34,546 were found guilty of 62,839 offences. These figures show an increase over those of 1957 when 35,458 adults were charged with 61,964 indictable offences and 31,765 were found guilty of 54,900 offences.

1.—Persons Convicted of Indictable Offences, with Ratio per 100,000 Population 16 Years of Age or Over, by Province, 1957 and 1958

Province or Territory	Persons Convicted		Persons Convicted per 100,000 Population 16 Years of Age or Over	
	1957	1958	1957	1958
	No.	No.	No.	No.
Newfoundland.....	703	575	290	231
Prince Edward Island.....	78	134	125	213
Nova Scotia.....	1,234	1,353	275	299
New Brunswick.....	827	991	240	283
Quebec.....	6,678	7,127	222	232

Yukon and Northwest Territories.....	67	76	345	382
Canada.....	31,765	34,546	292	311

Indictable offences are classified according to the main sources of the criminal law—the Criminal Code and Federal Statutes. Indictable offences under the Criminal Code are grouped into six classes as shown in Table 2. In 1958 persons convicted of assaults of various kinds and obstructing police represented 77.5 p.c. of Class I, which covers offences against the person. In that year 16 persons were convicted of murder, 11 of attempted murder and 82 of manslaughter as compared with 8, 10 and 110, respectively, in 1957.

Classes II to V deal with offences against property. Thefts predominate among the offences in these classes, and breaking and entering and robbery, serious crimes which involve acts of violence, are the next most numerous. In Class VI, which includes miscellaneous offences, the most numerous convictions are for offences connected with the improper operation of motor vehicles. In 1958 there were 488 offenders under the Opium and Narcotic Drug Act, of whom 397 were convicted of possessing heroin and 61 of trafficking; 334 were males and 442 were born in Canada. British Columbia courts convicted 61.7 p.c. of the drug offenders and Ontario courts 29.5 p.c.

CONVICTIONS OF MALES AND FEMALES FOR INDICTABLE OFFENCES,

Disposition of Cases and Recidivism.—Of all suspects before the courts for indictable offences in 1958, 89.9 p.c. were adjudged guilty; the convictions against males (90.1 p.c.) constituted a higher percentage than those against females (87.2 p.c.) and varied considerably between provinces. New Brunswick and Prince Edward Island showed the highest percentages (98.5 and 97.1 p.c., respectively) of convictions and Ontario the lowest (87.0 p.c.).

Sentences.—In 1958, 25.9 p.c. of the persons convicted of indictable offences were fined, 34.0 p.c. were sent to gaol without option of fine, 6.3 p.c. were committed to reformatories and 8.3 p.c. to penitentiaries, and 25.5 p.c. were given suspended sentences with or without probation. One habitual criminal was given preventive detention, eight persons received a life sentence and 16 were given the death penalty. The proportions in 1958 were much the same as in recent preceding years.

Court Proceedings.—In 1958, 64.1 p.c. of the persons tried by a judge and jury were convicted; trials by a judge without a jury brought convictions in 76.9 p.c. of the cases so tried; trials by a magistrate with consent ended in convictions in 92.4 p.c.; and those by a magistrate who has absolute jurisdiction, in 89.7 p.c. of the cases. Of the persons charged with an indictable offence, 92.6 p.c. were tried by magistrate or juvenile and family courts, 4.7 p.c. in county and district courts and 2.7 p.c. in higher courts.

Subsection 2.—Young* Adult Offenders (16-24 Years)

Young men and women from 16 to 24 years of age form 47.6 p.c. of the criminal population who commit indictable offences but they comprise less than 19.6 p.c. of the total population 16 years of age or over. As this age group includes some of the most daring offenders who may be already experienced criminals as well as first offenders likely to be turned from crime by further education and training, it seems worth while to give consideration to offenders in this group as distinct from offenders in the older age groups.

Of the young offenders in 1958, 56.9 p.c. were still under 20 years of age and 72.0 p.c. were tried in three provinces—Ontario 35.9 p.c., Quebec 23.5 p.c. and British Columbia 12.6 p.c.

In 1958, six of the 16 men found guilty of murder, 21 of the 80 convicted of manslaughter and 25 of the 52 found guilty of rape were under 25 years of age; 67.2 p.c. of the men convicted of breaking and entering, extortion and robbery were in that group as well as 53.6 p.c. of those found guilty of offences against property without violence (which include all thefts), 54.3 p.c. of those who maliciously damaged property, 48.5 p.c. of those found carrying offensive weapons and 62.6 p.c. of the prison escapees.

There were 2,034 female offenders in 1958, 804 of them under 25 years of age; 436 of the young offenders were guilty of theft and having in possession. Of the 154 women convicted under the Opium and Narcotic Drug Act, 46 were in the young adult group as were 52 of the 107 convicted of forgery and uttering; 12 of the 16 female prison escapees were also young women.

The sentences meted out to these young people vary somewhat from those given to offenders over 24 years of age. Usually a higher proportion of them are given suspended sentences, put on probation or sent to reformatories and a lower proportion fined or given gaol sentences.

13.—Disposition of Sentences for Indictable Offences, by Sex, 1957 and 1958

Through the system of suspended sentence and probation supervising, many young offenders receive another chance to make good, and reformatory training gives others an opportunity to better their employment possibilities. It is interesting to note that 23.0 p.c. of the young male offenders in 1958 were recorded as labourers, indicating that they had no particular skill by which to earn a living; the proportion of male offenders 25 years or over recorded as labourers was 16.7 p.c. Those recorded as students made up 9.1 p.c. of the youths, and 11.4 p.c. were reported as unemployed as compared with 3.5 p.c. of the older men. Approximately three of every four lived in urban centres.

Subsection 3.—Convictions for Summary Conviction Offences

Offences punishable on summary conviction—those not expressly made indictable—include all offences against the Criminal Code, provincial statutes and municipal by-laws. Summary conviction offences are triable by magistrate or justice of the peace under Part XXIV of the Criminal Code or under the provincial summary convictions Acts.

It is debatable how far summary conviction offences are of a criminal nature and whether their increase indicates an increase in crime. Many are breaches of municipal by-laws and contrary to public safety, health and comfort as, for example, parking violations or practising trades without licence, but they do not involve violence, cruelty or serious dishonesty. On the other hand, offences as serious as cruelty to animals and contributing to juvenile delinquency are included under this classification and such indictable offences as common assault and driving with ability impaired may be tried on summary conviction.

Summary convictions increased by 1.7 p.c. from 2,466,762 in 1957 to 2,508,976 in 1958. Decreases were shown in Newfoundland, Saskatchewan, Yukon Territory and the Northwest Territories.

14.—Convictions for Summary Conviction Offences, by Province, 1949-58

NOTE.—Figures for 1949, 1950 and all previous years are for the 12 months ended Sept. 30; those for 1951-58 are for the calendar year. Statistics for the intervening months, October-December 1950, are given in DBS report, *Statistics of Criminal and Other Offences* (Catalogue No. 85-201). Figures for 1900-48 are given in the corresponding table of previous Year Books beginning with the 1933 edition.

1958 . . .	14, 120	4, 172	24, 967	49, 815	506, 000	1, 404, 810	67, 353	59, 242	97, 136	278, 123	1, 686	1, 552	2, 508, 976

In considering statistics of summary convictions it should be remembered that such convictions are greatly influenced by the customs of the people and by the application and degree of enforcement of municipal regulations. These differ from place to place and from year to year and affect summary conviction offences more than they do indictable offences.

In 1958 decreases appeared in convictions under the Criminal Code, federal statutes, provincial statutes and municipal by-laws. Convictions for breaches of parking regulations under provincial statutes and municipal by-laws rose by 5.3 p.c.

15.—Convictions for Summary Conviction Offences, by Type, 1957 and 1958

Type of Offence	1957	1958	Increase or Decrease 1957-58
	No.	No.	p.c.
Criminal Code—			
Attempts, conspiracies, accessories, counselling.....	120	127	+ 5.8
Attempt to commit suicide.....	225	267	+18.7

For the year 1958, Ontario, with 39.9 p.c. of the registrations of motor vehicles in Canada, had 58.6 p.c. of the total convictions for breaches of traffic regulations; Quebec in the same year had 20.2 p.c. of the registered vehicles and 20.4 p.c. of the convictions. In interpreting the figures in this way, however, it should be pointed out that traffic regulations are by no means uniform throughout Canada and no account is taken of the differences in the degree of urbanization in the provinces. These two provinces have large urban centres but in provinces with lower degrees of urbanization, such as the Atlantic Provinces, Saskatchewan and Alberta, convictions are lower when considered in proportion to the number of motor vehicles registered.

Convictions for Drunkenness and Offences against the Liquor Acts.—In considering these convictions it should be noted that the same person may and often does appear before the courts on such charges more than once within a year and that the number of convictions may thus be well above the number of persons convicted.

17.—Convictions for Drunkenness, by Province, 1949-58

NOTE.—See headnote to Table 14, p. 357.

There is general interest in the relation of alcoholism to crime but, when examining statistics to support the assumption that some crimes are associated with the consumption of liquor, it should be observed that accurate interpretation would necessitate allowance for population variables such as age and sex distribution and other classifications according to social and economic status, etc.

Convictions of Females.—The number of convictions against females for summary conviction offences was greater in 1958 than in 1957 by 11.1 p.c. Prince Edward Island, Newfoundland, the Yukon and the Northwest Territories recorded decreases of 30.6 p.c., 7.2 p.c. and 6.3 p.c., respectively. Traffic offences were the cause of 86.7 p.c. of all summary convictions against women in 1958; such convictions rose by 13.9 p.c. as compared with 1957.

Section 3.—Juvenile Delinquents

The Juvenile Delinquents Act defines a child as "any boy or girl apparently or actually under the age of 16 years". Provision is made, however, by which the Governor General in Council may proclaim that in a province the definition of a child be a "person under the age of 18 years". This has been done in British Columbia, Manitoba and Quebec. Newfoundland considers a juvenile to be a girl or a boy of under 17 years of age. For uniformity the figures relating to juveniles compiled by the Dominion Bureau of Statistics refer to the younger ages of under 16 years only and deal primarily with cases disposed of by the courts.

The fact that juvenile court statistics furnish the most comprehensive figures collected on a country-wide basis makes it important that their possibilities and limitations be understood. This Section gives an account of juvenile delinquency in Canada from the viewpoint of legal action taken, for in the eyes of the law a *child is a delinquent only when he or she is adjudged before the court to have committed a delinquency*. To many people the term 'juvenile delinquent' has a broader interpretation but that adopted in this Section does not include those boys and girls whose misdemeanours have not been reported to the courts nor those given the necessary advice and aid from their parents, their school, the police or a child care agency. Moreover it does not include those cases that are handled unofficially by the court, where the judge or probation officer makes an adjustment without filing a legal record of the offence. There is a growing tendency toward following this practice and thus keeping children's names from court records.

These statistics represent cases of delinquency reported to the courts, from the most trivial infractions to the most serious—that of murder. The number of cases brought before the courts is influenced by such factors as personnel and facilities of the court, community interest in and understanding of the function of a juvenile court, and by variations in the policies of the courts in the disposition of cases. As more courts are established the additional returns may exaggerate an apparent increase in delinquency or may underestimate a decrease. In some communities the juvenile court is the only available agency to provide services to children; in others there are well established agencies serving children of which the juvenile court is only one.

It should be noted, too, that the total figures do not represent the actual number of children charged and found guilty but rather tend to exaggerate them, for a child referred to the court two or more times during the year for different delinquencies is counted as a different case each time (see p. 368). Neither do the figures represent the number of delinquencies committed by delinquents because when a child is charged with more than one delinquency at a hearing only the most serious delinquency is counted.

Reports of juvenile delinquents were received in 1958 from 147 of the 169 judicial districts. Nine of these had no cases to report. Separate reports were received in 1958 from 194 incorporated urban centres of 4,000 or more population.

Juveniles brought before the Courts.—The number of juveniles brought before the courts in 1958 was 13,134, an increase of 10.1 p.c. over 1957. Saskatchewan, Nova Scotia and New Brunswick showed the greatest percentage increases among the provinces.

22.—Juveniles brought before the Courts, by Province, 1954-58

Children Adjudged Delinquent.—Over a period of ten years it has been found that between 80 and 90 p.c. of the children brought before the courts each year have been adjudged delinquent. The number of delinquents in 1958 was 11,391, an increase of 17.7 p.c. over 1957. The major increases in 1958 were shown in Saskatchewan and Quebec.

Delinquencies.—Thieving is the most prevalent delinquency among boys and, together with having in possession, was the reason for court appearance in 39.0 p.c. of all cases in 1958. Breaking and entering and robbery were committed by 21.9 p.c. of the delinquent boys and another 9.5 p.c. committed wilful acts in respect of certain property. Only 3.2 p.c. of the boys were guilty of delinquencies against the person and 58.6 p.c. of these were found guilty of common assault.

Incorrigibility (23.5 p.c.) and theft and having in possession (22.3 p.c.) were the complaints against 45.8 p.c. of the delinquent girls in 1958.

PERCENTAGE INCREASE IN JUVENILE DELINQUENCIES,
1958 OVER 1954

Sex and Age.—Juvenile delinquents are predominantly boys. The proportion for all offences in 1958 was approximately one girl to eight boys, a ratio that has remained much the same over a long period. Juveniles of 13 to 15 years of age comprised the majority of delinquents in 1958—76.7 p.c. of the boys and 88.1 p.c. of the girls. However, 312 boys and 15 girls (2.9 p.c. of the children) were under 10 years of age.

27.—Percentages of Delinquent Boys and Girls, by Age Group, 1957 and 1958

Age Group	1957			1958		
	Boys	Girls	Both Sexes	Boys	Girls	Both Sexes
	p.c.	p.c.	p.c.	p.c.	p.c.	p.c.

13 - 15 years.....	75.8	88.0	77.3	76.7	88.1	78.0
Not given.....	0.2	—	0.1	0.3	0.3	0.3
Totals.....	100.0	100.0	100.0	100.0	100.0	100.0

Education and Employment.—Many causes contribute to backwardness in school work. The retarding influence may be illness, over-crowding in the home, disturbed family situations or dull mentality. Presuming that six years is the usual age for entering the first grade, 47.2 p.c. of the boys and girls in 1958 were reported to be two or more years below the normal grade for their age and 3.1 p.c. of the boys and girls were a year or more above it.

Nearly three-fifths (57.5 p.c.) of the boys and 47.6 p.c. of the girls had attained grade 7 at the time of delinquency. The majority of boys who had left school had reached grades 6 to 8 and the girls, grades 7 to 9. Some high school education had been achieved by 22.6 p.c. of the boys and girls.

Totals.....	1,187	72	980	90	1,339	148	1,883	277	1,912	317	2,067	329	103	25	581	76	10,057	1,334

In 1958, 11.0 p.c. of the delinquent boys and 14.1 p.c. of the delinquent girls were not attending school. At the time of leaving school their ages ranged from 8 to 15 years, the majority being 14 to 15 years. Of the delinquent boys who had left school, 43.1 p.c. were unemployed. The largest group of wage earners (103) were in occupations concerned

with transportation, such as messengers, helpers on milk delivery routes, truck drivers' assistants, etc. More than half of the girls were idle after leaving school. Factory work and domestic and personal services were the main occupations of those employed.

Birthplaces of Juvenile Delinquents and their Parents.—Canada was the country of birth of 92.4 p.c. of the juvenile delinquents in 1958 (the place of birth was not recorded in 1.5 p.c. of the cases); 6.0 p.c. were born in the British Isles, Europe, the United States, and Asia. Ontario was the province of residence of 50.1 p.c. of those born outside Canada.

Both parents of 74.2 p.c. of the delinquent children in 1958 were born in Canada and another 10.6 p.c. had one parent born in this country. To evaluate these figures, comparison should be made of the population ratio of children from 7-15 years of age whose parents were Canadian-born with those whose parents were born elsewhere.

Home Circumstances.—The type of home in which he lives and the amount and quality of supervision he receives are important factors in a child's behaviour. The statistics of the marital status of the parents and the place and type of residence of the child reflect home conditions and are worth recording as possible reasons for social or emotional maladjustment. The parents of 76.1 p.c. of the delinquent children were reported to be living together in 1958 but a home broken by separated parents, divorce or death was the background of 19.6 p.c. of the delinquent boys and girls. The mothers of 12.3 p.c. of the juvenile delinquents were employed other than in the home and the mothers of another 2.2 p.c. were dead. The fathers in 6.5 p.c. of the cases were deceased. Of every five juveniles who appeared in court, four were urban residents; 90.9 p.c. were living in their own homes at the time they got into difficulties; 4.0 p.c. of them were in foster homes, with either a relative or some other person; and institutions were the homes of 1.6 p.c. of them.

Sources of Complaint.—The police were the complainants in the majority of juvenile cases, 83.6 p.c. of the boys having been charged by them. Probation officers and parents were responsible for 4.5 p.c. and 3.5 p.c., respectively, of those charged. School authorities referred 1.8 p.c. of the boys to the courts and social agencies another 0.7 p.c.

The proportion (61.7 p.c.) of girls charged by the police was considerably less than the proportion of boys so charged. Parents made more use of the courts for girls than for boys (17.4 p.c.). School authorities laid complaints in 4.6 p.c., probation officers in 6.3 p.c. and social agencies in 3.6 p.c. of the girls' cases.

Disposition of Cases.—In 1958, 39.2 p.c. of the children's cases were heard within four days of the charge and 58.9 p.c. within nine days. However, 11.0 p.c. of them had to wait at least two weeks and 10.6 p.c. waited a month or more before the first hearing. These waiting periods may be explained in various ways.

Some county courts sit only twice or even once a month. Hearings may be deferred because of sickness in the family, school examinations, stormy weather or long distances. The chief cause for delay, however, is the time it takes to investigate the facts properly. The probation officer, and frequently there is only one to a court, has to find out what occurred at the time of the delinquency; he must get in touch with the parents and the school, learn something of the home situation, perhaps arrange medical or psychiatric examinations and explore community resources. The disadvantage of a long waiting period is outweighed by the assistance the court receives in deciding the form of treatment best suited to the child's needs and the type of care that will be the most economical for the community. For these intervening days or weeks most children are left in their own homes while a minority are placed in detention homes and, in the long run, whether the effect of the waiting period is good or bad is determined by the care given the youngster during that time.

Juvenile court judges heard 94.4 p.c. and magistrates 5.5 p.c. of the juvenile cases before the courts. The remainder were heard by justices of the peace. The proportion of those declared delinquent (96.1 p.c.) in the magistrates' courts was greater than in the juvenile courts (86.2 p.c.). In the former courts 3.3 p.c. of the cases were dismissed while in the juvenile courts only 3.1 p.c. were dismissed but 10.7 p.c. were adjourned *sine die*.

Some courts consider children whose hearings are adjourned *sine die* as delinquent while others do not but, for the sake of uniformity, the latter point of view is maintained by the Dominion Bureau of Statistics. In assessing the total problem of juvenile delinquency, however, cases adjourned *sine die* have to be taken into account for, when the proportion of cases dealt with in this way increases, the proportion of those declared delinquent declines.

Sentences for delinquent boys usually differ somewhat from those for girls. In 1958 the proportion of boys put on probation was 52.7 p.c. and of girls 54.0 p.c. Fines or restitution were meted out to 15.3 p.c. of the boys but to only 6.1 p.c. of the girls. This is because damage to property, for which restitution seems a reasonable adjustment, is committed relatively more often by boys than by girls. A much larger proportion of girls (28.2 p.c.) than boys (14.4 p.c.) were sent to training schools. Final disposition of case was postponed for 7.0 p.c. of the girls and 13.0 p.c. of the boys were given suspended sentences.

Actual Number of Delinquent Children.—As stated in the introduction to this Section, the figures in the foregoing tables do not represent the actual number of children charged and found guilty, since a child referred to the court more than once in a year is counted as a separate case each time. Thus the 13,134 appearances before the court in 1958 (Table 22), which resulted in 11,391 delinquencies (Table 24), involved 10,307 children. Of these 10,307 children, 9,404 were found delinquent on one occasion during the year, as shown in Table 31, but 1,340 of these 9,404 were reported as having been found delinquent one or more times in previous years.

Section 4.—Penal Institutions and Training Schools

Penal institutions may be classified under three headings: (1) penitentiaries, where prisoners have long sentences and the turnover is slow; (2) reformatories, where the turnover is also rather slow; and (3) common gaols, where the turnover is extremely rapid.

If the average of the figures for inmates at the beginning and at the end of the year be considered the average population for the year, and the number of discharged as the turnover, the turnover in the years 1957 and 1958 was: in penitentiaries, 56 and 64 p.c.; in reformatories, 362 and 352 p.c.; and in gaols, no less than 1,833 and 1,927 p.c., respectively.

Subsection 1.—Penitentiaries*

The penitentiaries of Canada are administered by the Commissioner of Penitentiaries, responsible directly to the Minister of Justice. The system comprises:—

- (1) Six primary institutions, which receive inmates sentenced by the courts to imprisonment for terms of two years up to life. These are located at New Westminster, B.C.; Prince Albert, Sask.; Stony Mountain, Man.; Kingston, Ont.; St. Vincent de Paul, Que.; and Dorchester, N.B. Persons sentenced to penitentiary terms in Newfoundland are cared for in a provincially operated institution at St. John's, Nfld., under financial arrangements authorized by Sect. 82 of the Penitentiary Act.
- (2) Four secondary institutions, to which inmates are transferred from the primary 'receiving' institutions on the basis of their suitability for special forms of treatment, including vocational training. Two of these (Collin's Bay Penitentiary and the Joyceville Institution) are within a few miles of Kingston. The Federal Training Centre and the soon-to-be-opened Leclerc Institution are in close proximity to St. Vincent de Paul Penitentiary.
- (3) Three 'satellite' work-camps, at William Head, B.C., Valleyfield, Que., and Springhill, N.S., operated as extensions of the primary institutions in their respective areas.
- (4) A Prison for Women, operated as a detached portion of Kingston Penitentiary, to which female inmates are transferred upon committal to penitentiary in any part of Canada.
- (5) A Penitentiary Staff College at Kingston for the training of groups of penitentiary officers from all institutions through the media of regular and special courses and conferences.

During the year ended Mar. 31, 1959, the average daily population of the penitentiaries was 5,935 and the total net cash outlay for maintenance was \$11,714,296 or \$5.41 per inmate per day.

Since the proclamation of the Penitentiary Act on Sept. 1, 1947, many of the recommendations of the Royal (Archambault) Commission (1938) have been carried out. The recommendations of the (Fauteux) Remission Service Committee (1956) inspired the establishment of a National Parole Board (see p. 371) and have, in addition, given rise to federal-provincial discussions on the advisability of extending the sphere of federal penitentiary responsibility to persons sentenced to shorter terms of imprisonment. In 1958 the Minister of Justice appointed a Correctional Planning Committee for the purpose of exploring the implications of that proposal and of considering other ways in which a more effective and more fully integrated Canadian correctional system could be achieved. Recent innovations, notably the establishment of work-camps for the care and training of selected inmates, have been made in the light of the Planning Committee's study and suggestions. Other aspects of its report are under consideration by the Federal Government.

* Prepared under the direction of R. B. Gibson, Commissioner of Penitentiaries.

The National Parole System.*—The progressive correctional system now in operation in Canada places emphasis on reformation rather than on punishment alone for the sake of retribution to society. It is quite obvious from past experience and from the high rate of recidivism among criminals that punishing a person for wrong-doing merely by depriving him of his freedom is not effective in turning that person from crime. It is therefore considered imperative that during his period of incarceration every possible means be taken to reform the inmate through treatment and training and through assistance with his personal problems. Not only is it highly desirable that the individual be given such assistance and returned to freedom as a useful citizen but it is also undoubtedly preferable for society generally that he be saved from the further resentment and bitterness that would result from imprisonment without assistance. The only way the public can be properly protected is by reforming the offender. Thus the treatment and training program in the institution is a vital part of the whole correctional process and parole is an extension of that training outside the institution.

In January 1959, the National Parole Board, consisting of a chairman and three members, was formed and given absolute jurisdiction over all matters of parole. It operates under authority of the Parole Act (SC 1958, c. 38) which came into force on Feb. 15, 1959, replacing the former Ticket-of-Leave Act administered by the Remission Service of the Department of Justice. The Board has taken over the Remission Service, and the staff of the Board, numbering 82 persons, is now known as the National Parole Service.

The basic purpose of parole is to reform and rehabilitate the offender and the function of the National Parole Board is to select those inmates in the various federal and provincial penal institutions who indicate that they sincerely intend to reform, and to assist them in doing so by grant of parole. The Board is not a reviewing authority and is not concerned with the propriety of conviction or the length of sentence but only with the

* Prepared by T. G. Street, Chairman, National Parole Board, Ottawa.

problem of deciding, in each case it considers, whether or not there is a reasonable chance of reformation. Parole should not be confused with clemency and is not granted on humanitarian grounds alone. It is not a matter of shortening sentence, although it has the effect of shortening the time a man spends in gaol. Parole means that an inmate is allowed to serve the remainder of his sentence at large in society but under certain restrictions that will ensure his leading a law-abiding life. These restrictions are designed for the protection of the public and for his own welfare.

The decision of the Board is based on reports it receives from the police, from the trial judge or magistrate and from various people at the institution who deal with the inmate. Reports are also obtained from a psychologist or psychiatrist, when available. Where necessary a community investigation is conducted to secure as much information as possible about the man's family and background, his work record, and his position in the community. From all these reports, an assessment is made to determine whether or not he has changed his attitude and is likely to lead a law-abiding life. An inmate need not obtain the services of a lawyer to apply for parole. He may apply by sending a letter to the Board and is assisted in preparing such application at the institution, or another person may apply on his behalf. The Board automatically reviews all sentences of over two years. As soon as an application is received, a file is opened and investigation begun, the results of which are presented to the Board for decision. All applications and reports are processed by the Parole Board staff at Ottawa. In addition to the headquarters staff, there are nine Regional Officers stationed across the country. They interview all applicants for parole to give them an opportunity of making verbal representations to a representative of the Board. The Regional Officers also submit to the Board a report of the interview and their assessment of the inmate's suitability for parole. These Regional Officers have authority over the parolees in their various areas, and also give information and counsel to all inmates regarding possibility of parole and preparation for it.

A person on parole is under the care of a supervisor, usually an after-care agency worker or a probation officer, who reports to the Regional Officer. If he violates the conditions of his parole or commits further offence or misbehaves in any manner, the Board may revoke his parole and return him to the institution to serve that part of his sentence outstanding at the time his parole was granted.

The inmate coming out of an institution faces many problems in regaining his place in society. He is assisted as much as possible by the members of the Parole Service, the after-care agencies and the provincial probation officers. But the success of the parole system depends on the public's understanding of the purpose of parole and its sympathy toward the problems of the ex-inmate. If he is unable to get a job or form new associations because of his past, the chances of his being rehabilitated are remote. However, with the increasing efficiency of the system, with greater co-operation and understanding among all people involved in the correction system and with the public generally, recidivism in Canada should be lessened and some of the problems of criminality solved.

Subsection 2.—Reformatories and Other Corrective Institutions

The latest information on reformatories and corrective institutions is that made available by the 1951 Census. Summary data only are given here.

As of June 1, 1951, there were 13 reformatory and corrective institutions, four of which were for women. Enumeration cards were completed for 2,551 men and 141 women on June 1, 1951. In these institutions for adults 29 p.c. of the inmates were under 21 years of age at the time of admission and almost 50 p.c. were between the ages of 21 and 39 years. The proportion of single men was 63 p.c. and three out of four of the men whose residence was known lived in urban centres. More than one-half of the women (53.2 p.c.) were single and the majority (91.0 p.c.) of those whose residence was known lived in urban centres. From five to eight years of elementary school education were recorded for about

one-half of the male and female inmates. Only 6.7 p.c. of the men were unemployed at the time of admission. On the other hand, 20.6 p.c. of the women were unemployed and another 34.0 p.c. had never worked.

The revenue for the support of the institutions for men was derived chiefly from provincial funds (56.0 p.c.) and from the sale by the institutions of farm and industrial products (41.3 p.c.). To support the institutions for women, income was received from provincial funds (31.0 p.c.), municipalities (1.8 p.c.), sale of products (53.4 p.c.), donations and bequests (4.6 p.c.) and other sources (9.2 p.c.).

Summary statistics of inmates, movement of population, terms of sentence and penal record of inmates are given in the 1954 Year Book, pp. 311-313.

Subsection 3.—Training Schools

Reports on movement of population are received yearly from training schools and figures compiled therefrom are shown in Table 35 for the years 1954 to 1958.

¹ The discrepancy between pupils in residence at end of year 1954 and those in residence at beginning of 1955 comes from the inclusion of seven adults in Home of the Good Shepherd, Saint John, N.B. ² The discrepancy between 1955 and 1956 comes from closing of St. Patrick's Home, Halifax, N.S. ³ The discrepancy between pupils in residence at end of year 1957 and those in residence at beginning of 1958, comes from the inclusion of 98 pupils in Good Shepherd Home, Edmonton, Alta. ⁴ The discrepancy of 12 pupils comes from the omission of Girls' Home and Training School, St. John's, Nfld.; this institution did not forward a return in 1958.

More detailed information on training schools is collected at each decennial census. Statistics compiled from the Census of 1951 are summarized in the 1954 Year Book, pp. 314-316.

Section 5.—Police Forces

The Police Forces operating in Canada are organized under three groups: (1) the Federal Force, which is the Royal Canadian Mounted Police whose operations cover a very wide field in addition to purely police work; (2) Provincial Police Forces—the Provinces of Ontario and Quebec have organized their own Provincial Forces, but the other provinces engage the services of the Royal Canadian Mounted Police to perform parallel functions within their boundaries; (3) Municipal Police—every urban centre of reasonable size has its own police organization which is paid for by the local taxpayers and which attends to police matters within the borders of the municipality concerned.

Municipal police statistics are at present undergoing revision and are therefore not carried in this edition of the Year Book.

Subsection 1.—The Royal Canadian Mounted Police*

The Royal Canadian Mounted Police is a Civil Force maintained by the Federal Government. It was organized in 1873 as the North West Mounted Police, with duties confined to what was then known as the North West Territories. By 1904 the work of the Force received signal recognition when the prefix "Royal" was bestowed upon it by His Majesty King Edward VII. In 1905 when Alberta and Saskatchewan were constituted provinces an arrangement was made whereby the Force continued to discharge its duties as formerly, each province making a contribution towards defraying the cost. This arrangement was continued until 1917.

In 1918 the Royal North West Mounted Police was assigned the duty of enforcing Dominion legislation for the whole of Canada west of Port Arthur and Fort William. Soon after the end of World War I an extension of governmental activities made it obvious that the enforcement of Dominion statutes throughout Canada must be the responsibility of a Dominion Force and therefore the jurisdiction of the Royal North West Mounted Police was extended to the whole of Canada early in 1920. In that year the name of the Force was changed to the Royal Canadian Mounted Police and the former Dominion Police with Headquarters at Ottawa, whose duties were largely connected with guarding public buildings in that city and Canadian Government dockyards at Halifax, N.S., and Esquimalt, B.C., was absorbed by the Royal Canadian Mounted Police.

The Force is controlled and administered by a Minister of the Crown (the Minister of Justice). Its Commissioner has the rank and status of a Deputy Minister. Officers are commissioned by the Crown and are selected from serving non-commissioned officers. The Force is divided into 17 Divisions, with 622 detachments distributed over the entire country. Land transportation facilities consist of 1,473 motor vehicles, most of which are fitted with two-way radio sets connecting with wireless stations operated by the Force in both Eastern and Western Canada, including the Quebec-United States boundary area. The Air Division of the Force operates 16 aircraft of various types. The strength of the Force at the end of 1959 was 5,382 officers and men, with a reserve strength of 246. The reserve strength is located chiefly in the larger cities where men can be congregated easily and where instruction can be given in the evenings. The Marine Division, with a strength of about 250 officers and men, operates 70 ships of various kinds, the majority of which are located on the Atlantic and Pacific Coasts and on the Great Lakes. The Personnel Branch of the Force has officers in each Division across the country. Great care is taken in the selection of recruits.

The Royal Canadian Mounted Police is responsible for enforcing federal laws throughout Canada and is specially empowered to deal with infractions against smuggling by sea, land and air. It also enforces the provisions of the Excise Act and is responsible for the suppression of traffic in narcotic drugs. In all, the Force has responsibility in over fifty Federal Government Acts, including the Indian Act. It also assists many departments of the Federal Government in administrative duties and is responsible for the protection of government buildings and property. It is the only police force operating in the Yukon and Northwest Territories. Furthermore it undertakes intelligence and security services for the Federal Government. In addition, agreements have been made with the Provinces of Alberta, Saskatchewan, Manitoba, Nova Scotia, New Brunswick, Prince Edward Island, Newfoundland and British Columbia whereby the services of the Royal Canadian Mounted Police may be secured to enforce provincial laws and the Criminal Code in rural districts upon payment for such services. The agreement with Saskatchewan has been in existence since 1928 and those with the Provinces of Alberta, Manitoba, New Brunswick, Nova Scotia and Prince Edward Island since 1932. The agreements were entered into with the Provinces of Newfoundland and British Columbia in August 1950, and the police forces of those provinces were absorbed by the Royal Canadian Mounted Police. The Force has agreements also for policing 118 district municipalities, cities and towns.

* Revised by the Commissioner of the Royal Canadian Mounted Police, Ottawa.

The services of Royal Canadian Mounted Police experts in fingerprints, crime-index information, examination of firearms and questioned documents are available to all other police forces in Canada. A *Police Gazette*, issued monthly and containing instructional articles on police work as well as the latest information on wanted or missing persons, is sent to all police forces across the country. The Force has two Police Colleges that are open to selected personnel from other police forces in Canada and to a more limited number of police personnel from outside the country.

A special article appears in the 1957-58 Year Book entitled "The Philosophy of the Royal Canadian Mounted Police".

Subsection 2.—Provincial Police Forces*

Quebec Provincial Police Force.—This Force is responsible for upholding law and order over the whole territory of the province, from the provincial boundary between Ontario and Quebec to the Magdalen Islands in the Gulf of St. Lawrence. The Force is composed of about 1,600 men under the orders of a Director, who is responsible to the Attorney General of the province.

To facilitate operations, the territory is divided into two almost equal parts designated as the District of Montreal and the District of Quebec. The Director has his office in Montreal, with a Deputy Director in Quebec City. There is an Assistant to the Director in Montreal and one in Quebec.

Working under the Assistant Directors for the Montreal and Quebec Districts are the following: an Inspector General; an Inspector (Detective Branch); an Inspector (Traffic Branch); and an Inspector (Constabulary). Each of these three sections (Detective, Traffic, Constabulary) is under a captain supported by a number of lieutenants and sergeants.

There are 40 Outpost Detachments in the Montreal District and 18 in the Quebec District.

Ontario Provincial Police.—The Ontario Provincial Police Force is maintained by the Ontario Government and administered by the Attorney General's Department. It is responsible for law enforcement in the rural and unorganized parts of the province and in certain municipalities by contract. The development of the Force from its beginning in the early years of Confederation to the passing of the Police Act in 1946 is outlined in the 1950 Year Book, pp. 332-333.

The Force, with a strength of approximately 1,860 in 1959, consists of a General Headquarters at Toronto and 17 District Headquarters at Chatham, London, Dundas, Niagara Falls, Toronto, Mount Forest, Barrie, Peterborough, Belleville, Perth, Cornwall, North Bay, Sudbury, Sault Ste. Marie, Timmins, Port Arthur and Kenora. Each District has detachments adequate to meet local law-enforcement requirements. A Criminal Investigations Branch, under the command of an Assistant Commissioner, is maintained at Toronto to handle crimes of a major nature.

The Force operates one of the largest frequency-modulation radio networks in the world, which is a most efficient method of combating every type of lawlessness. The network includes 66 fixed stations—48 60-watt stations and 18 250-watt stations, one of which is dual-controlled—and 582 radio-equipped mobile units including five boats operating on Lake Temagami, Lake Simcoe, Lake Nipissing, Lake of the Woods and Georgian Bay.

In 1959, the Ontario Provincial Police Force policed 55 municipalities which requested this service under the provisions of the Police Act.

* Revised by Geo. A. Shea, O.B.E., Secretary-Treasurer, Canadian Association of Chiefs of Police, Montreal.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

PART I.—FORMAL EDUCATION*

Section 1.—Education in the Provinces and Territories

Education in Canada has been moulded according to certain principles and practices which should be appreciated if the present education system is to be understood. First, on entering the Canadian federation, each province retained responsibility for exercising control of formal education within its own borders, a right as jealously guarded today as at that time. Second, there has been a division of responsibility from then on between the provincial departments of education and the local boards which operate under provincial school law and school regulations. Third, the Canadian people believe in education for all youth, as evidenced by the fact that much effort has been directed toward equalizing educational opportunity from elementary through secondary and higher education. Fourth, it is also recognized by Canadians that a high general education level on a broad front is necessary to safeguard their democratic way of life, to appreciate and exploit their natural resources to the full, and to assume their responsibilities in international fields.

Interest of the Federal Government in Education.—The Federal Government retains responsibility for the education of Indians and Eskimos, other children in the territories outside the provinces, inmates of provincial penitentiaries and members of the Armed Forces and their families living on military stations or overseas, although provincial educational facilities are utilized whenever possible.

* Information supplied by the Education Division, Dominion Bureau of Statistics.

Education of Indian children in Canada is a function of the Indian Affairs Branch of the Department of Citizenship and Immigration. Residential schools are provided for orphans, children from broken homes, and children of isolated families. Day schools are available for children living in communities and, where conditions are favourable, Indian children attend non-Indian schools. In addition, vocational and professional training is provided for Indian youths. (See also pp. 201-205.)

The provision of educational facilities for the nomadic Eskimo population, a responsibility of the Northern Administration Branch of the Department of Northern Affairs and National Resources, is a more difficult problem. There are now close to 50 schools established throughout the vast Northwest Territories at points scattered from the Mackenzie Delta to northern Quebec. Some of these are operated by religious missions assisted by government grants. All northerners attend the same schools, which range from the larger school at Yellowknife where a variety of vocational courses are given and where students may qualify for university entrance, to single classroom units in remote Eskimo settlements. Vocational training is considered so important for the Eskimo young people in certain areas that specially chosen groups are sent south to secure training in trades in which they may later find employment in their own communities. (See also pp. 205-210.)

Federal interest in education is also shown through grants to vocational education; grants to universities and colleges; grants for research and construction through the Canada Council; grants-in-aid for equipment and personnel to education institutions through the National Research Council, the Defence Research Board, the Department of National Health and Welfare and several other agencies of government. The Federal Government also assists formal and informal education at various levels through programs or materials provided by the National Film Board, the Canadian Broadcasting Corporation, the Department of National Health and Welfare, the Department of Agriculture, and so on. (See also p. 380.)

Administration and Organization of Education in the Provinces.—Because each of the ten provinces has the authority and responsibility for organizing its own system of education, with the legislature being responsible to the electorate for its decisions, there are in existence ten distinct provincial systems with differing policies, organizations and practices. Even so, in some respects a great deal of similarity has developed among the systems as a result of interchange of personnel and ideas, ease of transportation and communication, interprovincial and national education bodies, proximity, co-operation and emulation. Each province has established a department of education and, except in Quebec, each has a Cabinet Minister as Minister of Education. The Quebec department is administered by a Superintendent of Education—a non-political appointee—who maintains liaison with the Cabinet through the Minister of the Department of Youth; he is head of the Council of Education, composed of Roman Catholic and Protestant Committees which sit separately, each being responsible for the organization and discipline of its own public schools and teacher-training institutions, for conducting examinations for school inspectors, and for making recommendations to the Cabinet concerning school grants and certain specified appointments.

The provincial departments of education assist local boards in providing elementary and secondary schools and, in some cases, establish schools in isolated areas. In addition, they generally either establish schools for deaf and blind persons or make provision elsewhere for their education and also provide for the education of other atypical pupils. Teacher-training is conducted in provincial establishments or by arrangement with one or more universities, and trade schools or institutes are established by provincial departments where deemed expedient.

Local School Organization.—Authority has been delegated by the provincial departments of education to publicly elected or to appointed municipal boards, which function as corporations under the school Acts and regulations, and are held responsible to the provincial government and resident ratepayers for the operation of schools. Through such delegation of authority, publicly controlled education has become a provincial-local partnership with the degree of decentralization varying somewhat from province to province and from time to time. For example, matters concerning control of the curriculum, supervision and contributions of revenue to the boards are, and will continue to be, recurrent problems. Local boards may be elected, appointed or partly elected and partly appointed. They differ in number of members—usually three members for one-room rural districts but as many as five, seven or even twelve or more for urban units. Where larger units in rural areas have been established there are central boards for the unit representing the component districts, although there may be local boards which retain some custodial and advisory duties.

The larger unit replacing rural districts, which were usually about four miles in extent, was introduced by legislation in several provinces and made optional in others in an effort to provide better school facilities and greater equalization and to mitigate the problems caused by a chronic shortage of teachers. Larger units have been established by legislation in Alberta and British Columbia and by Acts with provision for local option in Saskatchewan and the Maritime Provinces. Southern Ontario has been gradually organizing its rural areas into county units; Manitoba has recently introduced legislation whereby communities will find it beneficial to form larger secondary units; and Protestant Quebec has been essentially organized into larger units. In Catholic Quebec one board of commissioners administers all Roman Catholic schools in a municipality, whether rural or urban. In that province there have always been more residential schools established by religious groups than elsewhere. In addition, the fact that Quebec has more than 100 vocational and agricultural schools has lessened the need for the composite type of school.

Larger units vary in organization. In some provinces the rural sections are formed into units of perhaps 80 or more rural schools; in others the towns and villages are included in the units, or may be included if they so desire; in still others secondary schools only are consolidated in the larger units. Usually each unit board is advised by a superintendent who maintains liaison with the department of education, and where units are headed by a professional educator there is a trend towards delegating more professional responsibilities to the unit board. In several provinces there remains the problem of making school administrative units and municipal units coterminous.

Each department of education, among its duties, undertakes to provide for the selection, training and certification of teacher candidates; to establish courses of study and prescribe school texts; to provide inspection services and liaison between the local boards and the department; to assist in financing the schools through grants and services; and to make rules and regulations for the guidance of trustees and teachers. In return, regular reports are required from the teachers and districts.

The first government grants were based on such factors as number of teachers, enrolment, days in session and attendance. Later, special grants were introduced in most provinces to meet a variety of expenses such as the erection of the first school and other construction, the organization of special classes, transportation for pupils, and school lunches. More recently, most provinces have made some provision for equalization grants and several have introduced a basic grant for operation supplemented by a limited number of special grants.

The public school system normally provides 12 or 13 years or grades, depending on the province. Common patterns for elementary and secondary levels are 8-4 or 8-5, 6-3-3 or 6-3-4, or 7-5. The trend is towards six elementary years with six or seven years of secondary schooling, following the practice of doing away with the one-room rural units through consolidation and the consolidation of small high schools. The generally accepted age of entrance to regular classes is now six years, although there has been an increased demand for kindergarten and nursery schools that has not been satisfied in many areas because of pressure for accommodation at the higher levels. Many private nursery schools and kindergartens have been established which have helped to ease the situation. The amount of supervision for these pre-school organizations varies widely from province to province but is usually minimal.

Parent-teacher and home and school organizations are numerous and active across Canada, giving community leadership in many areas connected with child instruction and welfare and working towards better schooling.

School Construction.—The development of larger school units and the consequent decrease in the number of one-room rural schools has tended to counterbalance the increase in the number of new schools erected to accommodate increased enrolment. Thus the total number of elementary and secondary schools has remained reasonably constant for some years although pupil accommodation has greatly increased year by year. At the higher education level, increased enrolment has resulted in an unprecedented expansion of facilities as well as in an upgrading of colleges into universities and in the establishment of new institutions. Planners and designers of new school buildings have paid greater attention to functional architecture, to the use of modern light-weight materials and to equipment possibilities. Gone are basements, towers, expensive trim and waste space, but more expensive heating, plumbing and ventilation systems have been incorporated. Flexibility has been introduced through non-bearing interior walls, easily movable desks and other equipment, and well-organized, smartly tailored rooms are common, featuring acoustic and glazed tile, terrazzo flooring, metal partitions, suspended ceilings and fluorescent fixtures. Warm colours are used for north rooms, cool colours for sunny rooms and special rooms are designed for such courses as home economics, mechanics, music and chemistry.

Most of the universities have conducted financial campaigns for expansion at some time during the past ten years and indications are that many more such campaigns must be undertaken in the near future. Despite expansion and modernization, there are still some old and crowded buildings in use which contrast sharply with the new well-planned, roomy, permanent structures on spacious campuses. All Canadian universities are expanding, whether they are located in the cramped heart of a city, have begun again in suburban areas, or were fortunate enough to have ample room on their first campus sites.

Special Education.—Each year increased provision is made for children who need special programs, particularly for those in the cities where numbers warrant such attention. There are in Canada six schools for the blind and nine schools for the deaf and in a number of centres classes are held for hard-of-hearing pupils and for those with poor vision. Other physically handicapped children for whom instruction is provided include cerebral-palsied, orthopaedic, and hospitalized and home-bound tubercular and delicate children as well as the mentally retarded and emotionally disturbed. In addition to the special assistance given to the handicapped, a limited number of classes are conducted for mentally gifted children. Special educational services are also provided for the Indian and Eskimo nomads of Northern Canada and for isolated children such as those serviced by railway-car classrooms in northern Ontario and by bus classrooms in British Columbia.

Altogether, about 50,000 children are cared for in one or another of 110 special public schools, 590 classes, and 130 private schools, some of which receive government aid. About 2,000 teachers conduct these services.

Financing Education.—Almost 3 p.c. of Canada's total national income, or about \$1,100,000,000, was expended on formal education during 1956. Just over 9 p.c. of all municipal, provincial and federal revenue went for education, with the municipalities providing 50 p.c. and the provinces 43 p.c. of the total. Municipal revenue is obtained mainly from direct taxes on land and improvements and from business taxes; provincial revenue is obtained from a variety of sources such as corporation taxes, sale of alcoholic beverages, tobacco, etc., licences, permits, etc., and from federal tax-rental agreements, and may also be secured through a special education tax of from 2 to 4 p.c. on sales.

Federal expenditures on education include sums for the education of Indians and Eskimos, children of members of the Armed Services, war dead and veterans. They also include grants to the National Federation of Universities to be divided among the provinces on a per capita basis and then distributed among the universities of a province according to the number of regular full-time students enrolled. Other grants are provided, usually on a matching basis, to the provinces for vocational education; scholarships and grants-in-aid of research are awarded to universities and individuals by the National Research Council, the Defence Research Board, the Canada Council and various departments of government; and grants for libraries and student residences are awarded through the Canada Council.

The provincial departments of education make grants to all publicly controlled schools and are also financially responsible for an increasing number of services. Such services, as mentioned previously, include the establishment and maintenance of teacher-training colleges or assistance to universities for the provision of that training; the establishment and maintenance of technical institutes and trade schools; and the provision of correspondence courses.

Municipal governments must provide money for buildings and equipment, maintenance and other operating expenditures. They must raise, by direct taxes, the difference between the amounts budgeted for by the school boards and the grants received from the provincial government. Provincial grants account for from 81 p.c. of the total school board revenue in Newfoundland to 35 p.c. in New Brunswick. Methods of payment vary. British Columbia, Nova Scotia and Manitoba no longer pay flat and incentive grants, but instead pay operation grants based on equalization formulas. Two other provinces—Newfoundland and Prince Edward Island—achieve a degree of equalization by paying the greater part of the cost of instruction. Ontario, Saskatchewan and Alberta make use of various flat and equalization grants, and New Brunswick and Quebec use flat and special grants. In addition, most provinces provide grants for capital expenditure, establish loan funds, and guarantee and assist in marketing debentures.

Private schools are normally supported from endowment income, gifts from religious or other sponsoring or operating bodies, and student fees.

Universities and colleges receive about 52 p.c. of their current operating expenditure from the federal and provincial governments, 30 p.c. from fees, 7 p.c. from endowments and gifts, and 11 p.c. from various other sources.

Vocational and Technical Education.—There has been considerable growth in vocational and technical education during the past decade. Technical education is mainly administered by the provincial departments of education, except in Quebec where it is administered by the Department of Youth. Across Canada approximately 200 pro-

vincial and municipal institutions give technical and trade training. Of these, 20 to 25 offer mainly post-secondary or advanced two-year or three-year technical courses, about 100 offer secondary-level industrial and trade courses, and 75 to 80 provide trade courses for apprentices.

Provincial trade schools and technical institutes are organized by the provinces to complement the work of the vocational schools and train qualified tradesmen and technicians. Contributions of the Federal Government, usually on a sharing basis with the province, have been a matter of contributing to the economic efficiency of the people in consideration of home and foreign markets. Grants are made according to agreement which provides for assistance to appropriate provincial government authorities operating acceptable vocational training projects. These schools are frequently assisted by industry, which may give financial assistance, employ students for the summer, assist in shaping the course of study, and provide equipment. Some of these schools offer a wide range of courses such as engineering technology, radio, electronics, metal trades, stenography, computing devices operation, and apprenticeship in the skilled trades.

Several other provincial departments of government offer specialized courses in such occupations as papermaking, textiles, mining, forestry, agriculture, navigation and dairying. The Armed Forces train certain recruits for technical positions in the Services and assist others to take university courses through extension or otherwise.

Nursing education is provided in schools of nursing attached to the larger hospitals, and advanced training is given in university hospitals.

Private trade schools, some offering correspondence courses only, give a wide variety of courses in fields ranging from hair styling to automotive engineering, and for occupations as dissimilar as artist, time-study engineer, and radio technician.

Teachers and Teachers' Salaries.—Candidates for teaching certificates are generally required to have high school completion or better, plus one year of professional training. Teacher training is given in provincial teacher-training colleges in courses lasting one school year or occasionally two, or in the universities where the training is usually combined with arts and science classes in a regular three-year or four-year university course. Secondary school teachers must have university graduation plus one year of professional training, or a special four-year university course in education.

In 1958-59 there were 119 normal schools and teachers' colleges preparing teachers, and 24 university faculties of education. Together these institutions graduated more than 10,000 teachers. In 1958-59 there were 142,157 full-time teachers in the elementary and secondary schools and 6,610 in universities and colleges; about 73 p.c. were women and 38 p.c. of these were married. The majority were between 24 and 45 years of age.

Teachers are generally employed according to a local salary schedule, belong to a provincial superannuation scheme and are members of a professional organization.

Research in Education.—The wide variety of research at present being undertaken in the field of education is expanding in scope and increasing in variety of method, and involves large numbers of personnel. Among the types found are historic and other studies, surveys, projects in applied research including action research, and a limited amount of basic or pure research. Most of the pure research is conducted in the universities by individuals or teams of professors and graduate students and the same personnel may conduct applied research. Applied research is also conducted by such organizations as the Canadian Education Association, the Canadian Teachers' Federation, the Education Division of the Dominion Bureau of Statistics, l'Association canadienne des Éducateurs

de Langue française, the Industrial Foundation on Education, the Canadian Universities Foundation, etc. In addition, certain of the departments of education and city school boards have research officers who, for the most part, conduct research into curricula examinations, promotion policies, use of visual aids, and related problems.

Operation or action research which developed during the Second World War has been adapted to many fields including education and is aimed at carrying out a certain operation as well as possible with the means available. Administrators and others are making considerable use of such procedure but it is difficult to decide just when such action should properly be designated as research.

One of the most promising portents for the future of research in education is the formation of provincial or regional councils to provide co-ordination of effort, to ensure professional advice, to publicize research findings, and to encourage research into imminent problems. Three such councils are well organized and publish journals. Several national bodies interested in research in education have formed a National Advisory Council on Educational Research which has provided liaison among its constituent bodies and is considering expanding its services through publications and advisory services.

During the past decade there have been several provincial Royal Commissions appointed to enquire into education as a whole, or some phase of it. Many of these have made use of research techniques as well as receiving submissions from interested bodies and individuals.

A number of longitudinal studies covering secondary pupils in one or several provinces are assessing the utilization of student resources related to university graduation. Other extensive studies have been, or are, related to school administration, visual aids and school finance. In addition, a limited amount of institutional research is being undertaken by several universities.

Section 2.—Statistics of Schools, Universities and Colleges

Education institutions may be grouped in the following categories: publicly controlled schools, privately controlled schools, universities and colleges, and federal schools. The publicly controlled schools, by far the largest group, include, in addition to all publicly controlled elementary and secondary schools, vocational institutes and trade schools, teacher-training colleges, correspondence courses, and schools for the blind and deaf. Private schools may be academic, business or trade schools, or correspondence schools. The universities and colleges may be provincial institutions, church institutions, or independent. The federal schools include those for Indians, schools in the Northwest Territories and schools overseas for children of members of the Armed Forces or for Armed Forces personnel. Evening courses may be given by public schools, usually assisted by provincial grants, by private schools, by universities or colleges, or by other organizations.

Table 1 shows the number of schools, teachers and pupils for all types of education institutions classified by province, for the academic year 1958-59. In all types of schools, the number of pupils has been increasing. The increase was first noticed at the elementary level some six years after the birth rate began to rise during the war years. In about eight years the children born during the War were entering high school and four years later they began entering university, swelling the ranks already greatly increased by an influx of veterans. The number of teachers is rather closely related to the number of students although the trend is toward larger classes. On the other hand, the number of schools has remained fairly constant, the increase caused by the construction of new and larger schools in urban areas being counterbalanced by the closing of many one-room rural schools.

¹ Day, residential and hospital schools administered by the Federal Government.
² Full-time, university grade.
³ Also included with "Higher Education".
⁴ Included with "Public and Separate—Pupils".
⁵ Included with Nova Scotia.

⁶ Enrolment by home province of pupils.

⁷ Apprenticeship training in Quebec is on a pre-employment basis.

⁸ Includes enrolment in federal penitentiaries, Indian reserves and Department of Veterans Affairs courses.

⁹ Included with public schools.

For the first time an attempt has been made to tabulate total expenditure on education, including formal education at all levels, vocational training of all types and also expenditures on cultural activities related to education such as adult night classes, fine arts and handicraft courses, and libraries, museums and art galleries. Such expenditure for the year 1956 is presented in Table 2, classified by source. Details of income of school boards for publicly controlled elementary and secondary schools for the years 1952-56 are given at pp. 391-392 and financial statistics for universities and colleges at pp. 396-398.

¹ Including the Yukon and Northwest Territories.

² Federal expenditure for blind and deaf Indians

and Eskimos.

³ Includes \$4,628,000 held in trust for Quebec universities.

⁴ Limited to reported expenditures of public funds.

⁵ Included in "Elementary and Secondary—Public schools".

Subsection 1.—Elementary and Secondary Schools

Control.—Direct control and operation of public schools is by school boards, which operate under school laws and regulations, and the members of which are elected or appointed usually for terms of two or three years. As stated on p. 378, through amalgamations and consolidations, schools are now operated by boards of larger units, local boards within larger units, independent boards for rural schools, towns or cities, and some by official trustees appointed by the province in lieu of a board. As their designations imply, private schools and federal schools are administered by private organizations and federal authorities, respectively.

Table 3 gives the number of active public school boards in each province in 1957 and indicates the type of board, the number of official trustees and the number of board members elected or appointed to these boards.

¹ Usually the school inspector, delegated to act where a board cannot be elected. necessary.

² Included with independent local boards.

² Estimated where

Enrolment.—Enrolment in all publicly controlled day schools increased from 1,092,633 in 1901 to 2,264,106 in 1931, but dropped during the 1930's and the early 1940's, when the birth rate was low, to 2,060,718 in 1944. After 1944 it rose slowly for some years and then at an accelerated rate to reach 3,548,206 in 1957. From 1954 to 1957 enrolment advanced by 228,000 a year for the country as a whole though the increase varied from province to province, ranging from 5 p.c. for Prince Edward Island and 11 p.c. for Saskatchewan to 26 p.c. for Ontario and 32 p.c. for British Columbia.

Enrolment in private elementary and secondary schools accounts for 4 p.c. of the total enrolment in these schools. The number of private school pupils, which was 100,000 in 1950 and 1952, rose rather sharply to a peak of 151,141 in 1956 but dropped slightly to 150,476 in 1957.

Table 4 shows enrolment of all elementary and secondary pupils in the provinces and territories and in Department of National Defence schools overseas, and classifies them by grade. It also shows the numbers attending private and Indian schools in each province and territory.

Teaching Staffs.—Between the school years ended in 1939 and 1959 the number of teachers in the publicly controlled schools in the ten provinces increased 89 p.c. from 75,446 to 142,157. The number of men teachers increased 94.6 p.c. and the number of women teachers 186.2 p.c.

In 1959, in the nine provinces outside of Quebec, 77.7 p.c. of the teachers had at least senior matriculation and one year of professional training, and an additional 12.2 p.c. had one year less schooling. Median experience in the eight provinces outside of Ontario and Quebec has slowly increased from 6.7 years in 1939 to 8.3 years in 1959, despite the large numbers of new teachers each year. Many of these have been recruited by the cities, where the median experience has declined from a high of 16.7 years in 1946 to 10.4 years in 1958 and 11.0 years in 1959.

Between 1939 and 1959, median salaries for all teachers in the nine provinces other than Quebec increased 339.9 p.c. from \$854 to \$3,757, while that for teachers in one-room schools increased 135.7 p.c. from \$607 to \$2,645. The annual increments beginning with a modest 2 p.c. in 1945 accelerated year by year to reach 6.1 p.c. in 1954, decreasing slightly to 4.7 p.c. in 1958 but increasing to 7.0 p.c. in 1959. Increases over the 20 years varied among the provinces from 161.7 p.c. in British Columbia to only 11.1 p.c. in Saskatchewan.

Table 5 gives information on the number, median salary, median experience, and qualifications for elementary and secondary teachers in all provinces.

¹ Comprises teachers and principals instructing or supervising kindergarten and elementary grades only, and those instructing or supervising both elementary and secondary grades in rural schools with five or fewer classes. Teachers and principals in Ontario are classified as elementary according to the provincial *Report of the Minister, 1958*.

² Fully qualified at the elementary level are teachers with junior matriculation and two or more years, or senior matriculation and one or more years of professional training. At the secondary level they are teachers with junior matriculation and four or more years, or senior matriculation and three or more years of schooling, of which one year was professional training. All teachers in Quebec were considered as fully qualified if they had a minimum of two years training after junior matriculation. Consequently, the Quebec data are not comparable with the data for the other provinces.

³ Comprises teachers and principals instructing or supervising both elementary and secondary grades in urban centres and in rural schools with six or more classes. Teachers and principals in Ontario are classified as secondary according to the provincial *Report of the Minister, 1958*.

Financial Support.—The public elementary and secondary schools are financed almost wholly from provincial grants and money derived from local taxation. Fees for elementary schooling may be charged in Quebec. In a few of the other provinces nominal fees are charged for the higher secondary grades; in Newfoundland there is little local taxation and fees are generally charged.

In general, school boards submit their budgets to the local municipal councils which levy for and collect the required amounts. However, school boards in Quebec and a few in other provinces have the power to levy and collect taxes for school purposes. Assessment, on which taxes for school purposes are levied, is the total valuation of land and

buildings, and sometimes improvements, personal property or business income are included. Steps have been taken by several provinces to equalize real property assessment over large areas or even over the whole province.

Each province has its own method of apportioning funds to local school boards. Grants are of two types. (1) The basic grant may be calculated on a minimum cost determined by an amount per classroom, salary and qualifications of the teacher, average attendance, etc. All provinces make some attempt to equalize educational opportunity through basing grants in part on some indication of need. (2) Special grants are paid to assist with transportation, music, arts and crafts, special classes, equipment, building costs, night classes, etc. These are largest in Quebec where there is marked emphasis on training for home industries, arts and crafts.

Newfoundland schools are supported largely from provincial funds. Tuition fees may be charged by school boards and by the boards of the colleges (actually schools of fairly high standard giving elementary and high school instruction) in the city of St. John's; additional fees may be charged for fuel or janitor service where these are not provided by pupils or their families. There has been no local taxation until very recently and it now exists only in a few of the larger centres. The provincial government pays teachers according to experience and qualifications and some school boards supplement this amount. The province also makes annual grants for plant maintenance and repairs and for new construction.

Table 6 presents a comparative statement of the finances of school boards operating publicly controlled schools, in so far as this information is available.

6.—Income of School Boards of Publicly Controlled Elementary and Secondary Schools, by Province, Fiscal Years Ended 1952-56

NOTE.—The receipts shown in this table do not include any amounts raised by loans or the sale of bonds or debentures as all revenue of this nature must be repaid ultimately with money raised by local taxation. Figures from 1914 are given in the corresponding table of previous Year Books beginning with the 1936 edition.

² Data for 1952 and 1953 are for the school year ended in June; those for subsequent years have been adjusted to the calendar year to correspond with the fiscal years of the other provinces.

Subsection 2.—Universities and Colleges

Institutions.—At the beginning of the 1958-59 academic year there were in Canada 339 institutions of higher education offering one or more years of degree-credit courses. Table 7 gives their distribution by province. Of the total, 292 were under the control of religious bodies (225 Catholic), 23 under provincial government control, three under Federal Government control, and 21 under private non-denominational control.

7.—Number of Institutions of Higher Education, by Province, Academic Year 1958-59

Totals.....	18	37	284	339

Enrolment.—Full-time university-grade enrolment exceeded 100,000 for the first time in 1959-60. Preliminary figures show 102,000 such students in attendance. Indications are that enrolments may well be double the 1959-60 figure in about 10 years. Table 8 gives figures on enrolment, by province, for the academic years ended 1957-60.

¹ Figures show enrolment at Dec. 1 of the academic year noted and comprise actual graduate enrolment reported, subtracted from preliminary figures for total enrolment based on Dec. 1 data available.

Foreign enrolment has risen considerably since the end of World War II, with a larger proportion of students from countries other than the United States and the United Kingdom coming to Canadian institutions, as shown in Table 9. In 1958-59 one of about 17 full-time university students in Canada was a resident of a country other than Canada. Hong Kong, Trinidad and the United Kingdom each accounted for over 500 students while France, India and Jamaica contributed from 100 to 200 each. Just over 100 other countries or territories are represented in the figures.

9.—Students from Other Countries in Canadian Universities, and Canadian Students in Universities in the United States and the United Kingdom, Selected Academic Years Ended 1931-59.

School of Fine Arts of Montreal.

⁵ Includes all diplomas and degrees except for Bachelors of Divinity.⁶ Includes M. Com., M.Ed., M.Paed., M.S.W., as well as M.A. In some institutions, M.Sc. degrees are included

with M.A.'s.

⁷ Includes M.A.Sc., M.S.A., M.Sc.F., M. Arch., M.V.Sc., M.Sc. Dent., M. Surgery (where

conferred separately), as well as M.Sc.

⁸ The "Licence" in the French language universities is the next

degree in advance of the Bachelor.

Teaching Staffs.—Table 11 shows the trend in university teaching staffs since 1950.

11.—Full-Time Teaching Complement in Universities and Colleges, Academic Years Ended 1950-59

NOTE.—Figures for 1957-59 are based on returns from a sampling of institutions and are subject to revision. It appears that figures for earlier years may have been too high owing to the inclusion of non-teaching and junior research staff members.

¹ Includes 22 ungraded professors.

Finances.—Since 1952, grants from federal, provincial and municipal governments to a group of institutions representing about 80 p.c. of the total full-time university-grade, enrolments have exceeded half of the total current income, less ancillary enterprises. Table 13 gives a historical series of the finances of this group of institutions. The institutions omitted are mainly those conducted by religious orders where teachers receive little or no salary and for which financial returns are consequently not comparable.

13.—Current Income and Expenditure of Universities and Colleges, Academic Years Ended 1948-57

NOTE.—Institutions included represent about 80 p.c. of the total full-time university-grade enrolment.

¹ Board and lodging not included.

The Federal Government established a system of university grants for current operating purposes, the first of which were paid during the academic year ended 1952. The grants were paid on the basis of 50 cents per head of population in each province, the eligible institutions receiving their shares of the total provincial allotment according to the number of full-time students at university level attending degree or graduate diploma courses. For 1956-57 and 1957-58 the payment was \$1 per head of population. In 1958-59 it was increased to \$1.50 per head of population. The distribution of payments, by province, is shown in Table 14.

14.—Federal Government Grants to Universities, by Province, Academic Years Ended 1956-60

NOTE.—Figures for 1952-55 are given in the 1959 Year Book, pp. 356-357.

¹ See text on p. 396 for basis of grant.

² Institutions in Quebec did not accept payment for the years 1952-53 to 1955-56. For 1956-57 and subsequent years, payments refused were held in trust by the National Conference of Canadian Universities. In 1957-58, one institution accepted the grant, and in 1958-59, two. For 1959-60 all eligible institutions were expected to accept.

During the 1956-57 academic year, plans were announced by the Federal Government for the distribution of \$50,000,000 to Canadian universities and colleges for new construction and capital equipment projects. The grants are made in an amount not exceeding 50 p.c. of the cost of specific building or capital equipment projects, with appropriate regard to the population of each province. The University Capital Grants Fund is administered by the Canada Council, which came into existence on Mar. 28, 1957. Up to Mar. 31, 1959, 31 institutions received a total of \$12,816,564 in capital grants. The Council was also endowed with an additional \$50,000,000 for the provision of scholarships and other assistance in the fields of the arts, humanities and social sciences. (See pp. 403-405.)

PART II.—CULTURAL ACTIVITIES RELATED TO EDUCATION

Section 1.—Art and Education*

Fine Art Schools, Galleries and Museums.—Fine art appears as an elective subject of the faculty of arts in a number of universities, where it may be taken as one of five, six or more subjects for a year or two. In Mount Allison University, N.B., and in the Universities of Saskatchewan and Manitoba, there is a sufficient number of courses to allow the taking of a Bachelor degree with specialization in fine art. At the University of Toronto an Honour B.A. in art history and archaeology is offered, as well as graduate work in this field. Departments of fine art were opened by McGill University in 1948-49, by the University of British Columbia in 1949-50 and by the University of Alberta in 1953-54; McMaster University reopened its department in 1951.

Confusion is often caused by the fact that some universities stress the history of art and others its practice. In 1958 the National Gallery sponsored a conference of university art departments, and a movement was begun towards the attainment of a proper ratio between the number of courses in history and in practice of art. A recommendation was also made for the establishment of a second centre of graduate studies (in addition to that at Toronto), preferably in Montreal.

There are also schools of art not requiring any fixed academic standing for admission, as they are more concerned with the technical development of the artist. The most widely known of these are:—

Nova Scotia College of Art, Halifax, N.S.

École des Beaux-Arts, Quebec, Que.

École des Beaux-Arts, Montreal, Que.

School of Art and Design, Montreal Museum of Fine Arts, Montreal, Que.

Ontario College of Art, Toronto, Ont.

University of Manitoba School of Art, Winnipeg, Man.

School of Art, Regina College, Regina, Sask.

Provincial Institute of Technology and Art, Banff School of Fine Arts,
Banff, Alta. (affiliated with the University of Alberta, Edmonton)

Vancouver School of Art, Vancouver, B.C.

Courses in these schools vary in length with the requirements of the individual student but may extend over as many as four years. Summer schools of art are sponsored by some of the foregoing institutions, by universities, and by various independent groups.

Public art galleries and museums in the principal cities perform valuable educational services among adults and children. Children's Saturday classes, conducted tours for school pupils and adults, radio talks, lectures and often concerts are features of the programs of the various galleries. Many of these institutions supply their surrounding areas with travelling exhibitions, and organizations such as the Maritime Art Association, the

* Revised under the direction of the Director of the National Gallery of Canada, Ottawa.

Western Canada Art Circuit, the Saskatchewan Arts Board and the Art Institute of Ontario have been founded to carry on the work on a regional basis. The National Gallery of Canada has a nation-wide program of this nature.

The principal art galleries and museums* are:—

Beaverbrook Gallery, Fredericton, N.B.
 New Brunswick Museum, Saint John, N.B.
 Museum of the Province of Quebec, Quebec, Que.
 Montreal Museum of Fine Arts, Montreal, Que.
 National Gallery of Canada, Ottawa, Ont.
 London Public Library and Art Museum, London, Ont.
 Art Gallery of Toronto, Toronto, Ont.
 Royal Ontario Museum, Toronto, Ont.
 Art Gallery of Hamilton, Hamilton, Ont.
 Winnipeg Art Gallery, Winnipeg, Man.
 Mackenzie Art Gallery, Regina, Sask.
 Calgary Allied Arts Centre, Calgary, Alta.
 Edmonton Art Gallery, Edmonton, Alta.
 Vancouver Art Gallery, Vancouver, B.C.
 Art Gallery of Greater Victoria, Victoria, B.C.

Other Art Organizations.—The leading art organizations of national scope, exclusive of museums and art galleries, include the following:—

Association of Canadian Industrial Designers
 Canadian Arts Council
 Canadian Group of Painters
 Canadian Guild of Potters
 Canadian Handicrafts Guild
 Canadian Museums Association
 Canadian Society of Graphic Art
 Canadian Society of Painter-Etchers and Engravers
 Canadian Society of Painters in Water Colour
 Canadian Society of Landscape Architects and Townplanners
 Community Planning Association of Canada
 Federation of Canadian Artists
 Royal Canadian Academy of Arts
 Royal Architectural Institute of Canada
 Sculptors Society of Canada.

The National Gallery of Canada.—The National Gallery was founded in 1880 by the Marquis of Lorne, then Governor General of Canada, and at first served only as an exhibition gallery. In 1907 it was provided with an Advisory Arts Council and in 1913 was first incorporated under a Board of Trustees. Since then it has assembled a permanent collection of pictures and sculpture, prints and drawings, representing the styles, past and present, of various parts of the world, intended for the enjoyment of the public and the improvement of arts and industrial products, and to form the basis of a program of art education. The National Gallery Act, amended in 1951, gave the institution a larger Board of Trustees and other advantages.

The collection of the National Gallery today is of international repute and is accessible to the whole country by means of catalogues, photographs, colour reproductions and, to a limited extent, by loans. The Canadian section, naturally the most inclusive, is the best available source for the study of Canadian art. Each year, examples of the best contemporary work are added, along with those of earlier periods.

The National Gallery conducts a program of extension work throughout the country. The majority of its special exhibitions are available to the entire country and are widely circulated. About 30 such exhibitions are toured and as many as 200 separate showings have been held annually under the auspices of the National Gallery of Canada. In addition, individual loans of material from the collection are made to centres in many parts of the country each year. In this way original works of art are constantly being brought to the attention of the public. Sets of reproductions are also sent on tour of localities that have not the facilities for handling originals.

* A complete list of Canadian art museums, societies and schools is included in the Canadian section of the current issue of the *American Art Directory* (R. R. Bowker Co., New York).

An Industrial Design Division has been set up as the result of public interest in bringing the design of Canadian goods up to the best international standards and in fostering distinctive Canadian designs. The Design Centre, operated as part of the National Gallery, serves as an exhibition centre and as headquarters for the national program in industrial design. Exhibitions have been held in various parts of the country.

Other methods of education in the arts apply more specifically to young people and are designed, in part, to supplement regular school work. The Gallery provides written lectures illustrated by lantern slides on all aspects of art history, reproductions of paintings with introductory texts for art appreciation, school broadcasts, classes for school children at the Gallery, exhibitions of children's art, conducted tours of the Gallery's collections and educational demonstrations. Lecture tours by well known authorities are also held throughout Canada. The National Gallery also maintains a library of art films. The facsimile colour reproductions published by the National Gallery are listed in a leaflet, available on request.

The *Report of the Royal Commission on National Development in the Arts, Letters and Sciences* made recommendations for the extension and improvement of the Gallery's exhibition and education services; increases in funds, staff and facilities; maintenance or increase of appropriations for acquisitions; and a new building containing adequate facilities for display, storage, circulation of exhibitions and conservation of paintings. These recommendations have been carried out and the National Gallery, together with the Design Centre, is now housed in the new Lorne Building constructed in 1959. The building is located in central Ottawa easily accessible to residents and visitors. Details concerning recent purchases, exhibitions and lecture tours arranged by the National Gallery are contained in the *Annual Report of the Board of Trustees*.

Section 2.—The Educational and Cultural Functions of the National Film Board

The National Film Board, an agency of the Federal Government, was established by Act of Parliament in 1939 and reconstituted by the National Film Act in 1950. In the years since its establishment, the Board has grown from a supervisory body over Canadian Government motion picture activities to a national documentary film-producing and -distributing organization whose films about Canada are seen wherever people may freely assemble. The Board also produces and distributes filmstrips and still photos on Canadian themes in accordance with its primary function outlined in the Act "to initiate and promote the production and distribution of films in the national interest". Films are produced primarily in the English and French languages and, whenever possible, foreign language versions are prepared to increase the usefulness of Board films in foreign countries.

The 16mm. community film program in Canada is based on a nation-wide system of film circuits, film councils and libraries, strongly supported by organizations and individuals engaged in community activities. At present, there are more than 600 national, provincial and community film distribution outlets from which thousands of 16mm. prints are available for public use throughout the country. These prints are acquired for circulation by purchase or by loan from the Board.

More than one-half of the 16mm. community film audience recorded by the Board during the year was reached through classroom showings, indicating further progress in the development of audio-visual aid programs in Canadian schools and universities. Another noticeable trend was the more selective use of films by community organizations and groups for particular purposes. This is attributed in part to the availability of Board productions which present series of film studies related to central themes, and to the availability of a broad range of topics which include individual films particularly suited to group objectives and programs. For example, a series of thirteen films, *The Commonwealth of Nations*, which examined the history and development of the Commonwealth, was given wide promotion and circulation among Canadian schools and study groups following its initial showing over English and French television networks.

Films produced by the Board are shown in commercial theatres and on television in Canada and abroad. Theatrically, films are released domestically in the series *Canada Carries On* and *Eye Witness* (*En Avant Canada* and *Coup d'Oeil* in French), and newsreel features are also issued regularly for theatrical and television purposes. Distribution of theatrical subjects is arranged by contract with commercial distributing organizations.

An increasing proportion of the Board's production and distribution program is initially concerned with television at home and abroad. Series of original films are shown regularly over English and French language television networks in Canada. Individual films from the Board's extensive general library are available to CBC and privately operated stations. Abroad, because of expanding television facilities in many countries, Board films are seen by audiences which could not otherwise be reached.

In addition to commercial distribution through theatres and television in other countries, 16mm. print circulation is carried on through posts of the Departments of External Affairs and Trade and Commerce, through National Film Board territorial offices at London in England, New York and Chicago in the United States, and New Delhi in India, as well as through libraries operated by various education agencies. Hundreds of prints of National Film Board films are also sold in other countries each year. Exchange agreements are in effect between the Board and government film-producing organizations in other lands; this means that films of various nations are freely exchanged with Canada, aiding better international understanding.

The National Film Board maintains a library of more than 150,000 still photographs, which are available at nominal cost to magazines, newspapers and other periodicals wishing to present current information about Canada.

Section 3.—The Educational and Cultural Functions of the Canadian Broadcasting Corporation

Many hours of educational or semi-educational programs are broadcast annually by the Canadian Broadcasting Corporation in English and in French. Whether these programs are directed to children or adults, entertainment is combined with information whenever possible. Spoken-word programs cover a very wide range of interests and are presented as readings, talks, discussions, documentary programs, dramatizations or in forms combined with music.

Pre-school Broadcasts.—Though many story programs for pre-school-age children are broadcast purely as entertainment, a special series has been developed to give young children, particularly in remote areas, many of the benefits of kindergarten training. This series, *Kindergarten of the Air*, is broadcast Monday to Friday for children from three and a half to six years of age. Planned with the advice of kindergarten experts, it includes stories, songs, simple games and development exercises, and encourages good habits of hygiene, eating and relaxation. Another similar series entitled *Nursery School Time* was begun as an experiment in 1958. It was enthusiastically received and, as a consequence, was given a regular place in the CBC national network schedule. Produced on alternate days from Toronto and Montreal, *Nursery School Time* is planned by experts in the training of three-and-a-half to five-year-old children.

During the spring of 1959 an experiment was begun in the use of television to teach a second language to pre-school-age children. A ten-minute segment of the adult program *Speaking French* was provided for this purpose. The results justified the establishment of a self-contained program called *Chez Hélène* which utilizes the Tan-Gau method of language instruction. It is presented daily on the CBC national television network.

School Broadcasts.—In an average school year, more than 1,000 school programs, mostly in dramatized form, are broadcast to all parts of Canada. The CBC provides facilities for 30-minute daily programs specifically planned by departments of education to meet classroom requirements. These are aids to help teachers stimulate student

imagination and strengthen motives for study. The National School Broadcasts series are planned by the National Advisory Council on School Broadcasting to promote among students a stronger consciousness of Canada and its achievements. During the 1958-59 season, programs for students in grades 4 to 13 were presented in eight sub-series. The perennial favourite for students in grades 4 to 6, *Voices of the Wild*, was again presented. Other series were: *They Explored Canada*, dramatized accounts of Canadian explorers; *Going My Way*, the story of transportation in Canada told for grade 4 to 6 students; *Macbeth*, a radio version of the Shakespearean play in five instalments for high school students; *Music in the Making*, a music appreciation series for grades 6 to 10 in which radio drama and a symphony orchestra were combined to heighten the students' appreciation of Handel's music; *Life in Canada Today*, actuality visits to Canadians at work; *Commonwealth Roundup*, radio visits to people living in other Commonwealth nations; and *What's In the News*, a weekly up-to-the-minute commentary on outstanding news events.

Over the past several years the CBC, acting on the advice of the National Advisory Council on School Broadcasting, carried out a number of nation-wide experiments in the use of television as a classroom teaching aid. These were supplemented by local experiments carried out by municipal boards of education and provincial departments of education. All experiments were carefully evaluated by classroom teachers and education officials and the results indicated that television had a useful function in the classroom as a supplement to the work of the teacher. The CBC therefore agreed to present a national series of 26 school telecasts during the first three months of 1960. *Rhythm and Melody* for grades 2 and 3 was planned to provide a stimulus in developing the child's enjoyment of music. *Child Life in Other Lands*, for the same grades, supplemented the teaching of social studies by giving the child visual experience with the people he was studying. A series for grades 4 to 6 called *The Face of Canada* dealt with the geography of Canada and a second series for this group, *Science About Us*, was planned to stimulate the child's curiosity about the wonders of the everyday world around him. For grades 7 to 9, a series of 10-minute programs gave current news topics and a series of 20-minute programs was conducted on Canadian history; the latter series, *Where History Was Made*, took the child, through the camera's eye, to sites of great events in Canada's history and gave him a vivid picture of life at these places at the time the event occurred.

During 1959 the Province of Manitoba, in co-operation with the CBC, conducted a series of school telecasts for that province. The Toronto Board of Education plans to present a series of school telecasts in 1960 through the CBC facilities in Toronto, and the Provinces of Manitoba, Saskatchewan, Alberta and British Columbia are jointly planning school telecasts for schools in those provinces, also in co-operation with the CBC.

Adult Education.—Programs of an adult education nature are presented frequently by the CBC on its radio and television services, in the planning of which co-operation is received from various educational organizations. The CBC is an active participant in the work of the Joint Planning Commission, a body established by the Canadian Association for Adult Education for exchange of information and co-ordination of plans for adult education in Canada.

Citizens' Forum, a series telecast for the past four years, is a round-table program on which a panel of informed speakers who hold varying viewpoints discuss important issues of the day. It is arranged jointly by the Canadian Association for Adult Education and the CBC. Its French counterpart, *Les idées en marche*, which is carried on television (on radio its equivalent is *Des idées et des hommes*), is planned in co-operation with La Société canadienne d'éducation des adultes. Similar types of programs prepared especially for rural listeners are *National Farm Radio Forum* and *Le réveil rural* and *Le choc des idées*, arranged by the CBC in co-operation with the Canadian Federation of Agriculture and the Canadian Association for Adult Education. All these forum programs are heard by organized listening groups, which continue the discussion of the topic at the conclusion of the program.

For the past eight summers the evening sessions of the Couchiching Conference have been broadcast. This week-long conference, organized jointly with the Canadian Institute on Public Affairs, examines Canadian and international affairs in open meetings and group discussions. On the French TV and radio networks, annual sessions of *L'Institut canadien des affaires publiques* are carried. Other programs of an educational nature are *Soundings*, a series of radio documentaries dealing with community and social affairs; various dramatized series in the field of human relations and mental health; *Science Review*, which examines important discoveries in the field of the natural sciences and their branches; *Business Barometer*, designed to inform listeners of developments in Canada's economic life; *Anthology*, a literary program with emphasis on Canadian writers; *Trans-Canada Matinée*, a daily afternoon program including informative talks and commentaries designed especially for the woman in the home; *University of the Air*, a series varying from four to eight talks prepared and broadcast by distinguished professors in their specialized fields; and, on the French radio network, *L'Université radiophonique internationale*, a series of talks exchanged with other countries on cultural and scientific subjects.

On the French network *Les Chansons de la maison* presents a series of programs relating to parents and children; and general questions sent in by parents are answered by psychologists. For women listeners, the daytime program *Femina* is presented five times a week. The French network also broadcasts a number of weekly programs dealing with fine arts, music, literature, theatrical arts, sciences, religion and philosophy, under the auspices of *Le Service des émissions éducatives et d'affaires publiques*.

In addition to *Citizens' Forum*, programs carried regularly on both radio and television are *Press Conference*, in which people who make the news are questioned by those who report it; and *Fighting Words*, in which guest experts in various fields discuss controversial quotations sent in by viewers. The French network equivalent of *Press Conference* is *Tribune libre*. *Open House*, a daily program for women, presents information on a wide variety of commodities and services, and interviews with people of note; its French network equivalent is *Bonjour Madame*. Significant issues, events and ideas, both international and domestic, are considered each Sunday on *Background*. *Explorations*, a series of drama documentaries which examines questions in the fields of sociology and the natural sciences, was one of seven CBC programs to win First Awards at the Exhibition of Educational Radio and Television Programs at Columbus, Ohio. Programs in the field of parent education and mental health are also broadcast. Portions of afternoon sessions of the Winter Conference of the Canadian Institute on Public Affairs were telecast. This three-day weekend conference examined sociological questions in open meetings and group discussions. On the French network *Affaires de famille* considers topics and problems of interest to teenagers.

Section 4.—The Canada Council

On Feb. 15, 1957, the House of Commons passed an Act for the Establishment of a Canada Council for the Encouragement of the Arts, Humanities and Social Sciences. The continuing objects of this body are to foster and promote the study and enjoyment of, and the production of works in, the arts, humanities and social sciences. The expression, "the arts" is defined by the Canada Council Act as: architecture, the arts of the theatre, literature, music, painting, sculpture, the graphic arts, and other similar creative and interpretative activities. The Council, in furtherance of its objects, may (a) assist, co-operate with and enlist the aid of organizations, the objects of which are similar to any of the objects of the Council; (b) provide a scheme of scholarships, fellowships and other grants to persons in Canada for study or research in the arts, humanities and social sciences in Canada or elsewhere, and to persons in other countries for study and research in the same subjects in Canada; (c) make awards to persons in Canada for outstanding accomplishment in the arts, humanities and social sciences; (d) arrange for and sponsor exhibitions, performances and publications of works in the arts, humanities and social sciences; (e) exchange with other organizations or persons and with other countries knowledge and information respecting the arts, humanities and social sciences; (f) arrange for

representation and interpretation of Canadian arts, humanities and social sciences in other countries. In addition, the Canada Council may be assigned by the Governor in Council such functions and duties in relation to the United Nations Educational, Scientific and Cultural Organizations (UNESCO) as he considers desirable.

The Council is a corporation consisting of a Chairman, a Vice-Chairman and nineteen other members, all appointed by the Governor in Council. The Chairman and Vice-Chairman are appointed for terms not exceeding five years and the other members for terms of three years each. After serving two terms, members of the Council, including the Chairman and Vice-Chairman, are not eligible for re-appointment during the twelve months following completion of the second term. The principal officers of the organization are the Director and the Associate Director, also appointed by the Governor in Council, the Treasurer, the Secretary, the Supervisor of the Arts Programme and the Supervisor of the Scholarship Programme. The Council is not an agent of the Crown, but its officers and employees are considered to be employed in the Public Service for the purposes of the Public Service Superannuation Act. The Council is deemed to be a charitable organization in Canada.

The continuing work of the Council will be financed by income from a permanent Endowment Fund of \$50,000,000 and by a University Capital Grants Fund of \$50,000,000, both to be paid out of the Consolidated Revenue Fund. The latter Fund and the income it earns will be completely expended by the Council over an unspecified but presumably short period of years. This Fund will enable the Council to make grants to universities and other institutions of higher learning by way of capital assistance in respect of building projects, with the following limitations: (a) a grant for any one project may not exceed one-half the total expenditures made in respect of that project; (b) in any province the aggregate of the grants made may not exceed an amount that is in the same proportion to the aggregate amount credited to the University Capital Grants Fund as the population of the province (latest census) is to the aggregate population of the provinces in which there is a university or other similar institution of higher learning. The Canada Council is also permitted to expend and administer any gifts and bequests it may receive.

To aid and advise the Council in making, managing and disposing of investments under the Canada Council Act, an Investment Committee has been set up consisting of the Chairman of the Council, one other member of the Council designated by the Council, and three members appointed by the Governor in Council. Proceeds from the sale or other disposition of any investments made out of the Endowment Fund or the University Capital Grants Fund are credited to the Fund out of which the investment was made. Investments out of money standing to the credit of the University Capital Grants Fund are made only in bonds or other securities of, or guaranteed by, the Government of Canada.

The Governor in Council appoints a member of the Queen's Privy Council for Canada to whom at the end of each fiscal year the Chairman reports all proceedings under the Canada Council Act for that fiscal year, including the financial statements of the Council and the Auditor General's report thereon. Provision is made for a review of these reports by Parliament.

During its second year of operations ended Mar. 31, 1959, the Council provided for or authorized awards as follows: scholarships, fellowships and other awards for 571 persons in the amount of \$1,215,000 of which about 75 p.c. were in the humanities and social sciences; grants to organizations representing the arts, humanities and social sciences, \$1,436,591, of which the larger portion was for the arts; grants for capital assistance to universities in respect of building construction projects, \$8,732,264.

Income from the Endowment Fund for the year ended Mar. 31, 1959, was \$2,758,760. Administrative expenses (including those occasioned by the University Capital Grants Fund, the UNESCO program and the purchase of equipment) were \$294,458. Total expenditures from the Endowment Fund were \$2,960,757, thereby reducing the surplus carried over from the first year of partial operations by \$201,997. To Mar. 31, 1959, the Council authorized expenditures from the University Capital Grants Fund and the Endowment Fund amounting to \$17,302,269.

In accordance with Order in Council dated June 14, 1957, the Council established the National Commission for UNESCO and named 26 members and 30 organizations with "co-operating body status".

Section 5.—Library Services

The National Library.—The National Library of Canada, authorized by the National Library Act of June 18, 1952 (RSC 1952, c. 330), came into existence formally on Jan. 1, 1953. The Act provides for the establishment of an Advisory Council of 15 members, including at least one representative from each of the ten provinces together with the appointment of a National Librarian, an Assistant Librarian and other personnel. The duties of the National Librarian include the establishment of a National Union Catalogue listing the books in every important collection in Canada; the purchasing of book stock; and the publication of a National Bibliography listing books published in Canada, written by Canadians, or of special interest to Canadians.

Since its establishment, the Library has continued to expand its activities in temporary quarters while awaiting the erection of a new building. The first stage of the *National Union Catalogue*, which lists the holdings of larger public reference, government, university and special libraries, was completed in November 1958. Included were data covering two libraries in Newfoundland, two in Prince Edward Island, 19 in Nova Scotia, 5 in New Brunswick, 14 in Quebec, 73 in Ontario, 4 in Manitoba, 3 in Saskatchewan, 4 in Alberta and 10 in British Columbia. Statistics on interlibrary loans facilitated by the Catalogue demonstrate its usefulness to scholars and research workers across the country. Approximately 1,000 requests are being filled each month, about half of which are received from university libraries, one-quarter from public libraries and the remainder from special libraries and other sources. *Canadiana*, issued monthly, provides an up-to-date inclusive bibliography of materials of Canadian origin and interest for the use of libraries, the publishing trade and others. Altogether, 9,230 items were listed in 1959.

In addition to Canadian books, the National Library is acquiring material in other subject fields, especially in the humanities, music and the social sciences.

Public Libraries.—Library service is provided for the Canadian public through several types of organization, depending on the population density of the area.

The majority of Canadians live in urban municipalities and are served by free tax-supported libraries, some with extensive branch systems. A few of the larger centres and many of the smaller municipalities are served by non-profit association public libraries, privately controlled and operated. A wide range of special services, from reference collections for business and industry, reading clubs, lecture series, art displays and services to schools supplement the basic reference and circulation collections for children and adults in these larger centres.

Regional and co-operative libraries are organized in all provinces except Quebec to centralize and strengthen the efforts of small communities to provide adequate library service for their people. Quebec late in 1959 introduced legislation providing for a study of public library needs in the province with a view to regional library organization. Regional libraries in Canada have pioneered in the use of mobile libraries to bring books to suburban and rural communities and to small libraries in need of replenishment.

Provincial public library services, operated on a province-wide basis by provincial government authorities, serve sparsely populated areas by rail, boat and aircraft. Traveling libraries, consisting of boxed collections of books for all ages, are sent out to small groups on request, books dealing with specific subjects are sent out to individuals on request and other forms of library service are tailored to the needs of certain areas. In Ontario the provincial government operates and finances a public library service at Moose Factory which is intended to be the beginning of service to the whole James Bay area. In Quebec, the McLennan Travelling Library at Macdonald College, financed through endowment and the provincial government, brings books by bookmobile to seven small communities in the Eastern Townships, and also distributes travelling collections. In British Columbia, the Provincial Library Commission maintains three branch depots in remote areas to service small local libraries.

All public libraries in Canada are experiencing increased demands for their services, especially from children of five to 14 years of age who, representing 20 p.c. of the population, borrowed 46 p.c. of all the books circulated in 1957. Stocks of books, pamphlets and periodicals are increasing, and new buildings, extensions and remodellings are being planned, although expansion is limited by a shortage of professional librarians.

DBS surveys of libraries for the year 1958 covered provincial public library services, regional and co-operative libraries and public libraries in centres with over 10,000 population. The data thus secured was supplemented by information from provincial officials on libraries in smaller centres. Table 1 represents estimates for all public libraries in Canada.

³ Excludes duplication.

Academic Libraries.—DBS surveys for the academic years 1957-58 and 1958-59 included all university and college libraries serving full-time student enrolments at the university level of 500 or more. Student enrolment in the 32 institutions in this category accounted for more than 90 p.c. of the total enrolment in all Canadian universities and colleges. Table 2 contains preliminary data for 1958-59 with comparative totals for the same group for the previous year. University library facilities are being expanded to meet rising enrolment, which increased 15.4 p.c. in the institutions under survey from 1957-58 to 1958-59. Many new library buildings and extensions, financed by the Canada Council, private benefactors and community organizations, are appearing on the campuses.

2.—Summary Statistics for University and College Libraries, Academic Year 1958-59

Salaries of Professional Library Employees.—Public libraries in urban centres with over 10,000 population, regional public libraries, provincial public library services and university libraries employ most of the professional librarians in the country. Median salaries, by position, are given in Table 3, based on reports from these libraries for the calendar year 1958 and the academic year 1958-59.

3.—Median Salaries of Librarians in Professional Positions, 1958-59

Section 6.—Canada and the United Nations Educational, Scientific and Cultural Organization

In the words of its constitution, the purpose of the United Nations Educational, Scientific and Cultural Organization (UNESCO) is "to contribute to peace and security by promoting collaboration among the nations through education, science and culture in order to further universal respect for justice, for the rule of law, for human rights and fundamental freedoms".

Total membership in the Organization includes 81 States and six associate members. The Organization is made up of three principal organs—the General Conference, the Executive Board, and the Secretariat. The General Conference is the policy-making body. It meets every two years and its main functions are to consider applications for membership, elect the Executive Board, plan the program and approve the budget for the ensuing two-year period.

In accordance with resolutions adopted at the 1956 General Conference held in New Delhi, India, UNESCO is now working actively on three major projects: the extension of primary education in Latin America; scientific research on arid lands; and the mutual appreciation of the cultural values of the Occident and the Orient. The tenth session of the General Conference held in Paris in November 1958 adopted plans to further these projects and to carry out other activities in UNESCO's program areas of education, natural sciences, social sciences, cultural activities, mass communications, technical assistance and exchange of persons. The Organization's budget for 1960 is approximately \$13,000,000. At the Canadian assessment level of 2.94 p.c., Canada's contribution for the period is in the neighbourhood of \$380,000.

In Canada, the Department of External Affairs discharges the responsibilities arising from membership in an international intergovernmental organization. It has the advice and assistance of the Canadian National Commission for UNESCO which was established by the Canada Council in August 1957. The National Commission is the agency responsible for co-ordinating Canadian participation in UNESCO's program both at home and abroad. Twenty-eight representatives of voluntary organizations and public bodies constitute the formal membership of the Commission. Part of this membership is chosen on a rotating basis, biennially, from a group of some 50 national voluntary organizations associated with the Commission as "co-operating bodies". The National Commission also has a number of consulting members who represent government agencies. Its first annual meeting and national conference was held in Montreal in March 1959. The Commission's secretariat is located in Ottawa at the Headquarters of the Canada Council.

PART III.—SCIENTIFIC AND INDUSTRIAL RESEARCH

Section 1.—The National Research Council*

History and Organization.—Organized research in Canada on a national basis dates from 1916 when the Government of Canada established the Honorary Advisory Council for Scientific and Industrial Research under a Committee of the Privy Council. Provision was made for the planning and integration of research work, organization of co-operative investigations, postgraduate training of research workers, and prosecution of research through grants-in-aid to university professors. This was the basis of the Council's work from 1916 to 1924.

A Special Committee of Parliament, appointed to study a recommendation for establishing national laboratories, endorsed the proposal and the Research Council Act was revised by Parliament in 1924. Temporary laboratories were secured and research on utilization of magnesians limestone for refractories was carried out so successfully that a wartime industry, established during World War I, was re-established on a large scale. As a result of this achievement the Government, in 1929-30, provided funds for new laboratories.

The National Research Building on Sussex Drive, Ottawa, was opened in 1932, and in 1939 construction was begun of the aerodynamics building on a 130-acre site on the Montreal Road just east of the city. Later, other buildings were erected on this site, including woodworking and metalworking shops and separate laboratories for research

* Prepared by R. A. Lay, Public Relations Office, National Research Council of Canada, Ottawa.

on engines, gas and oil, hydraulics and structures. These facilities have since been enlarged and extended and new buildings have been provided for engineering, low-temperature studies, and high-speed aerodynamics. In 1952 a cosmic ray laboratory, a thermodynamics building, and a large structure to house the Division of Applied Chemistry were added; in 1953 the Building Research Centre was completed. The same year, development began on a new 250-acre site on the opposite side of the road, where headquarters for the Radio and Electrical Engineering Division was constructed. In 1958, a unique Fire Research Laboratory was added to this site as part of the facilities of the Division of Building Research. An underpass connects the two areas.

A Prairie Regional Laboratory built on the University of Saskatchewan campus has been in operation since June 1948 and an Atlantic Regional Laboratory, on the campus of Dalhousie University at Halifax, N.S., was opened in June 1952. The Division of Building Research has established one of the most northerly building research stations in the world at Norman Wells, N.W.T. Completing its long-term plan for regional activities, the Division has also established a small Pacific Regional Station at Vancouver, in co-operation with the British Columbia Research Council.

The National Research Council consists of the President, two Vice-Presidents (Scientific), one Vice-President (Administration) and 17 other members, each of the latter group being appointed for a term of three years and chosen to represent industry, labour, or research in one of the basic natural sciences. Many of the members are drawn from the science departments of Canadian universities.

The Council's scientific and engineering activities are organized in ten divisions and two regional laboratories, each with its own director. Five laboratory divisions are concerned with fundamental and applied studies in the natural sciences—applied biology, applied and pure chemistry, and applied and pure physics. Four others are devoted chiefly to engineering work—building research, mechanical engineering, the National Aeronautical Establishment, and radio and electrical engineering. The Division of Medical Research has no laboratories but awards grants-in-aid and fellowships tenable chiefly in the medical schools of Canadian universities (see pp. 414 and 427-429).

Links with Industry.—In addition to its basic research foundations, the Council operates a Technical Information Service. Through a trained research staff, using the extensive library facilities available to the Council, it is usually possible to provide any required information at very short notice. A free and constant flow of personnel and information is maintained between the Council laboratories and industrial laboratories, the aim being to have Canadian industry use the Council's laboratories just as the units of a large company use their own laboratories as a source of scientific information and assistance. The Council also undertakes for any firm, under contract, research problems that cannot be solved by private consulting and testing laboratories and, in return, obtains assistance from many companies. The Council has long-standing and intimate contacts of this co-operative kind with many Canadian industries in various fields.

Associate committees were established by the National Research Council early in its history and have been continued to date. Hundreds of specialists have accepted invitations from the Council to serve on committees and have brought their knowledge and experience to bear on the solution of research problems put before them. Members of committees give their time and effort to these special studies without charge and their assistance is a source of great strength to the Council.

Foundation Aspects.—Assisted research grants have been made by the Council since its inception in 1916. These awards are given to heads of university science departments to purchase needed equipment and to employ junior helpers, usually students. Aid of this kind has been of considerable assistance in enabling the universities to put into operation the excellent graduate schools that now exist in Canada. In the year ended Mar. 31, 1960, more than \$8,200,000 was provided out of Council funds for basic research at Canadian universities.

Scholarships and grants-in-aid of research are awarded annually by the National Research Council. Scholarships awarded in science and engineering include Bursaries and Studentships with values of \$1,800 and \$2,200 respectively, Special Scholarships valued at \$2,200, and Postdoctorate Overseas Fellowships at \$2,700 (single) and \$3,500 (married). The Council also offers Graduate Medical Research Fellowships valued at from \$3,000 to \$5,000 depending upon academic qualifications and research experience. A limited number of Medical Research Associates and Postdoctoral Medical Research Assistants are also appointed to research positions in the medical schools of Canadian universities. Graduate Dental Research Fellowships are also available. In the year ended Mar. 31, 1960, 474 of these different awards totalling more than \$1,500,000 were made.

Since 1948, the National Research Council has awarded Postdoctorate Fellowships in open competition to Canadians and nationals of other countries, which are tenable in the Council's own laboratories. The diversity of training and experience brought to the laboratories by these keen young scientists has had such a stimulating effect on the research effort that the program has been expanded in recent years; Fellowships are also tenable in the science departments of Canadian universities, in the laboratories of Atomic Energy of Canada Limited, and in the Federal Departments of Agriculture, Mines and Technical Surveys, and National Health and Welfare. More than 200 of these awards are being held at the present time (March 1960), mostly in the fields of chemistry, physics and biology.

Principal Activities in 1958-59

The activities of each Division are described in outline only, with occasional brief examples. The work of the Atlantic and Prairie Regional Laboratories is treated separately at pp. 414-415.

Applied Biology.—This Division's work includes applied investigations related to the national economy, and fundamental studies in microbiology, biochemistry and biophysics as a basis for future application in agriculture, medicine or industry.

Problems of preparation, preservation and storage of food constitute a large part of the Divisional work. Specific studies in 1958-59 involved changes effected in foods during freezing and frozen storage, insulation and cooling of railway refrigerator cars, aeration of fermentations, controlled atmosphere storage of fruit, the processing and storage of milk, effects of irradiation on fats, and tenderness of meat.

Statistical investigation of variability of protein content in shipments of Northern wheat was expanded, and computation continued in a long-range study of the correlation between wheat protein and rainfall and temperature in the Prairie Provinces. The physiological and biochemical changes in mammals, birds and man in adapting to cold are being investigated, as are the structure and function of plant cells, problems of photosynthesis and translocation in plants, the structural determination of chlorophyll, and blue-green algae implicated in sheep and cattle deaths.

Other work involves the preparation, chemistry and physical chemistry of proteins and lipoproteins, the composition and structure of carbohydrates and fats, and studies concerning micro-organisms related to the preparation, preservation and spoilage of food. A culture collection of about 3,000 yeasts, bacteria and fungi is maintained.

Applied Chemistry.—The Division of Applied Chemistry is concerned with supplying new scientific information for the development of Canada's natural resources and chemical industries. Although formerly much of the work involved solving immediate, specific problems, a larger part of the Divisional effort is now being devoted to more basic studies. This avoids conflict with industrial laboratories and consultants and, in addition to providing fundamental information, often produces practical results. For instance, recent studies in applied catalysis (the study of agents altering the speed of chemical reactions) also explained certain types of smog formation.

The eleven sections of the Division are: analytical chemistry, applied catalysis, applied physical chemistry, chemical engineering, colloid chemistry, corrosion, high polymer chemistry, metallurgical chemistry, physical organic chemistry, rubber and textiles. Much of the work falls under the general headings of petroleum or corrosion chemistry, in that several sections work on topics related to one of these fields.

A current project of both military and industrial significance is the use of lignin as a rubber reinforcing agent. Whereas carbon black had hitherto been regarded as the only suitable reinforcing agent, it has been shown that lignin is an extremely satisfactory, domestic, non-strategic alternative. In fact, enough lignin can be produced as a by-product of Canada's pulp industry to replace all the carbon black now used in North America—about 554,000 long tons annually.

Pure Chemistry.—The Division of Pure Chemistry is organized around a nucleus of outstanding Canadian chemists who direct about 50 young postdoctorate Fellows from all over the world. The work consists of long-term fundamental investigations in physical and organic chemistry.

The work in organic chemistry includes investigation of the structures of alkaloids, studies of the infrared spectra of steroids, the synthesis of porphyrins and of compounds labelled with isotopes. Other sections deal with chemical kinetics and photochemistry, the study of the ionization potentials of free radicals by mass spectrometry, Raman and infrared vibrational spectroscopy, and the application of high resolution proton magnetic resonance techniques to the study of hydrogen bonding and other molecular interactions. Still others study certain aspects of surface chemistry such as the thermal properties of simple solids and imperfections in the bulk and the surface of alkali halide crystals, the heats of micellization by microcalorimetry, and the thermodynamics and stress-strain relationships associated with the absorption of fluids by active carbons. There is also a small group interested in the chemistry of fats and oils, and one engaged in fibre research.

Applied Physics.—The work in Applied Physics is divided between research projects likely to be of practical value and the continual development of the fundamental standards on which measurements generally are based. All the fundamental physical standards in Canada are housed and serviced in this Division, which now has primary standards equal to any in the world in the fields of mass, length, time, electricity, temperature and radiation. New standards work will involve topics such as the temperature scale below the oxygen point, and the luminous intensity standards where inadequate knowledge has precluded international agreement.

An important addition to Canadian facilities was the cesium clock recently put into operation in the Division. This apparatus substitutes the natural and unchanging frequency of cesium atoms for conventional methods of time-keeping and frequency measurement—of great importance in scientific experiments where extremely small time intervals must be measured with the greatest possible accuracy, and also as a possible future substitute for the present astronomical basis for time. A similar apparatus using the transitions within thallium is now under construction.

The analytical plotter for making maps from aerial photographs has been licensed for production, and an important study has been carried out to determine the possible use of photogrammetry for legal surveys. Indications are that the photogrammetric techniques are more accurate than present field survey methods, and also provide permanent references, thus eliminating the present need for duplication of survey effort.

Work continues on several industrial noise problems, on the thermal properties of ceramics at high temperatures, and on the development of a remote-reading temperature, salinity and depth recorder for use in oceanographic research. The possible use of plasma motors to propel rockets in outer space is being investigated. A study of the gonadal dose received by adults in diagnostic radiography has been completed.

Pure Physics.—Investigations are under way on cosmic rays, low temperature and solid state physics, spectroscopy, X-ray diffraction and theoretical physics. The work is on fundamental problems which do not have immediate application but advance the frontiers of knowledge and supply the basis for further progress in the applied fields.

Cosmic ray data from Canadian stations were forwarded to the International Geophysical Year world data centres, where they are being used by many countries. These results are also being used with the results from stations in the Southern Hemisphere operated by the University of Tasmania in a joint analysis designed to give a clearer picture of the modulating mechanism, known to be of solar origin, effecting great decreases in cosmic ray activity over large areas of the earth's surface. A search was also made for particles in the cosmic ray flux of mass equivalent to about 500 times the electron mass, but their presence was not confirmed.

Investigations on the physical properties of metals and semiconductors have revealed that the thermoelectric powers of gold, silver and platinum at temperatures below 1° absolute are about 1,000 times greater than those predicted by current theory. Some interesting results have also been obtained about semiconductors (transistors are semi-conducting devices), which are playing an increasingly large role in industry.

The structure of atoms and molecules has been investigated by means of their ultra-violet, visible, infrared and microwave spectra. Precise determination of the distances between the atoms in a molecule has been obtained for several compounds. The rotation of one group of atoms with respect to another group within some molecules has also been investigated. Because a certain amount of energy is required to produce this internal rotation, knowledge of the rotation provides additional information about the forces between atoms in a molecule.

One of the studies of the theoretical physics group has been the problem of multiple scattering of charged particles. Single collisions of charged particles such as protons and electrons, with the electrons and nuclei of absorbing matter, are fairly well understood. The group has formulated a detailed theory for multiple scattering which seems to agree with experimental findings.

Building Research.—The search for technical improvements in housing dominates the work of this Division. The research program therefore covers all aspects of housing design, building materials and components, and studies in soil, snow and ice mechanics. Regional stations engaged in research and information are maintained in Halifax, Saskatoon and Vancouver.

Many of the results of Divisional work are expressed in the National Building Code of Canada, an advisory document on building regulations for the municipalities and provinces. The Code is now in use for over 40 p.c. of Canada's population, representing more than 50 p.c. of the urban population, and is gaining increasing recognition. One section of the Division also administers the housing regulations used for all houses built with National Housing Act assistance. Another acts as the secretariat of the Canadian Government Specifications Board.

Examples of Divisional projects are the behaviour of cement aggregates and light-weight concretes; the materials and techniques of masonry construction and plastering; atmospheric corrosion of metals; paint and acoustics research, and examination of the performance of walls, windows, chimneys and domestic heating systems. Other studies involve the bearing strength of ice; the fundamental properties of various soil types, including permafrost and muskeg; frost action in soils; avalanche research; and the effects on buildings of ground vibrations caused by blasting or earthquakes. A fire research laboratory provides facilities for all types of fire resistance, fire prevention and fire fighting tests.

Special studies have been made of techniques for winter construction, including the enclosure of construction projects and use of materials such as precast concrete. There is also a section devoted to problems of building in Northern Canada, where the presence of permafrost necessitates special building practices and economics. The applicability of prefabrication techniques to northern building is being investigated.

Mechanical Engineering.—This Division works mainly in the fields of mechanics, hydrodynamics (hydraulic engineering and naval architecture) and thermodynamics. Extensive work is undertaken for a variety of industries and for government departments. Problems of improving Canadian transport facilities and equipment receive much attention.

With investigations for the St. Lawrence Seaway largely completed, it has been possible to devote more time to harbour improvements for a number of Canadian ports, notably Saint John and Port Cartier. In the ship laboratory, detailed studies were made of propeller, rudder and hull design and performance; full-scale sea trials were carried out for three vessel types. Preliminary studies are under way on improving winter navigation by water.

Rail transport studies include projects on diesel and gas turbine locomotives and improvements in rolling-stock. In the air transport field, several laboratories of the Division and of the National Aeronautical Establishment are engaged in developing new aircraft for short and vertical take-off and landing. Such aircraft would be extremely useful for both commercial and military purposes, particularly in undeveloped areas. Work has continued on anti-icing of turbojet and turboprop engines and helicopter rotor blades, and a variety of complicated instrumentation and control system problems. Possible use of ozone as the oxidant in rocket propellant combinations is being investigated.

New facilities include laboratories for instrument and petroleum qualification. A calibration machine of 100,000-lb. range, intended as a national standard of force, has been installed.

National Aeronautical Establishment.—The National Aeronautical Establishment, comprising the aeronautical, flight and structural activities of the Division of Mechanical Engineering, was formed as a separate NRC Division effective Jan. 1, 1959. The research program involves problems of high and low speed aerodynamics. Various aspects of short and vertical take-off and landing and civil aviation problems such as runway roughness, air traffic control and airport lighting, are being investigated.

Several projects involve fatigue and fail-safe design of aircraft components and mechanical systems. A study has begun of non-metallic structural materials resistant to very high temperatures.

Construction is under way of a new tri-sonic wind tunnel for aerodynamic research with a speed range up to a Mach Number about 4.5, which will greatly increase the Division's capacity for aerodynamic research. The tunnel is an extremely advanced piece of equipment, comparing favourably with similar tunnels anywhere in the world.

Radio and Electrical Engineering.—About half of the Division's work consists of defence projects and the remainder is devoted to fundamental research and engineering development in electronics, electrical engineering and radiophysics. Applications of interest to Canadian industry receive special attention.

Work has continued on the application of electronic circuitry to electronic aids to navigation in a trend toward unattended operation of remote equipment such as shore lights, resulting in simplification of equipment and greatly reduced operating costs. A project is under way aimed at unattended operation of the Sable Island West Lighthouse, using daylight-controlled acetylene valves.

In the field of medical electronics, useful devices have been put into operation for the remote monitoring of blood-pressure and heart-rate during operations, with cathode-ray tube display of these phenomena. Another useful device is for monitoring venous pressure, and controlling the pumping rate of the venous bypass pump, in heart-lung bypass procedures. An infrared scanner, producing a film record of body temperature distribution in about three minutes, was developed to assist in the thermal investigation of breast cancer.

Techniques have been developed for producing and measuring extremely low pressures in gases, and have enabled a study of gas-solid interactions at very low surface concentrations. Important progress has been made in the study and development of large ground-based rigid radomes for the weather-protection of missile tracking and guiding radars.

Extensive aurora and meteor programs were carried out in connection with the International Geophysical Year. The weather radar at Penhold, Alta., was modified considerably, and some 7,000 ft. of filmed data were contributed to the Alberta Hail Study program.

Medical Research.*—The Division of Medical Research has no laboratories of its own: it makes grants and awards fellowships for extramural research in Canadian universities and their affiliated institutions. Basic medical investigations and clinical studies are supported.

Twelve Medical Research Associates have been appointed to Canadian universities. These are competent medical research scientists nominated by universities, which provide them with faculty appointments and research facilities supported on a full-time continuing basis. Thirty-five Graduate Medical Research Fellowships, designed to enable medical graduates to obtain further training in fundamental research and ranging in value from \$3,000 to \$5,000, have also been awarded and a new category of award, that of Senior Postdoctoral Medical Research Assistant, has been instituted.

Divisional funds for the year ended Mar. 31, 1960, were awarded as follows: annual grants in aid of research, \$461,500 (31 p.c. of the budget); grants for terms of three years or longer, \$639,500 (44 p.c.); non-recurring equipment grants, \$166,200 (12 p.c.); Medical Research Associateships, \$110,000 (7 p.c.); and Medical Research Fellowships, \$92,800 (6 p.c.).

Atlantic Regional Laboratory.—The Atlantic Regional Laboratory studies practical and fundamental problems related to the resources and industries of the Atlantic provinces. The problem of slime in the "white water" of pulp mills has been investigated some time. Several species of fungi in the slime, conditions affecting their growth, and the effectiveness of various fungicides have been established. Apparently the white water contains a substance which stimulates the growth of the organisms, and a project is being carried out to isolate it and determine its structure is under way. Dosage tests have been carried out on test animals to ascertain the safe use for humans of a blood anticoagulant previously developed in the Laboratory. The use in Europe of dried seaweed as animal feed has led to comparison of the biological value of algal proteins.

Investigation of the factors controlling the deposition of pitch in sulphite pulp mills has continued and various detergents have been tested as dispersives. Another continuing project is the study of cod-skins and the collagen found in them that is used as the mother substance for photo-engraving glue. A chemical examination is being made of an extract of a red alga plentiful in some Atlantic areas and which the United States now imports from Denmark for commercial use.

Basic chemistry involved in the fabrication of steel constitutes a long-term project, involving years of study of the chemical reactions taking place at high temperatures in blast and open-hearth furnaces, and which affect the properties and processing of the final products. An apparatus for drying kelp and eel-grass—seaweeds of commercial importance in the Atlantic area—is being developed.

Prairie Regional Laboratory.—The function of the Prairie Regional Laboratory is to promote and expand industrial uses for agricultural produce of the prairie region. Together with this applied work, fundamental studies are carried out on the basic chemical

* See also pp. 427-429.

structure of agricultural materials and the complicated processes associated with the growth and development of plants and micro-organisms. Plant growth and the formation of plant constituents are studied under precisely controlled conditions, and the chemical processes taking place in the plants at different stages of growth are investigated by means of radioactive compounds.

Increased yields of commercially important products from cultures of micro-organisms are being examined. Work is under way on the production of lysine and other essential amino acids of importance in human and animal nutrition, on antifungal antibiotics, and on alkaloids of value to the pharmaceutical industry. Work is continuing on a strain of mushroom that shows promise for use in livestock feeding.

A new technique has been developed for determining the fatty acid composition of oils and fats. The new method provides plant breeders with a simple means of analyzing oil from only a few seeds, thus enabling them to compare the value of various oil-seed crops and to select those of most use to agriculture and industry. Faster, more accurate, and requiring only one-thousandth the size of sample of standard techniques, the new method could also be used in medical research, production control in industry, and other fields of fat and oil chemistry.

A mechanical foam breaker has been developed for the fermentation industry, and work is continuing on an attempt to separate starch and gluten from wheat flour to provide a gluten additive for low protein flours. A project designed to increase the strength of insulating boards without increasing their density is under way.

Administration.—Administration of the foregoing laboratories is organized as a Division of Administration and Awards, which exists only to serve the scientist. The five service units of this Division are: Awards and Committee Services (Awards, Committees, Publications, Research Journals); Administrative Services (General Services, Purchasing, Personnel); Information Services (Technical Information Service, Library, Public Relations Office, and Liaison Offices in Ottawa, Washington, D.C., and London, England); Plant Engineering Services; and Legal and Patent Services. The latter group works closely with Canadian Patents and Development Limited (see p. 137). An expert on economic research acts as special assistant to the Assistant Director, Information Services.

Section 2.—Research in the Atomic Field*

Attention is now focussed throughout the world on the transition of atomic energy from a large uranium mining operation in support of military uses to a more durable phase when a great proportion of the expanding annual construction of new electric generating plants will employ nuclear energy. In Canada uranium mining and export has reached a value of about \$300,000,000 a year, so the transition is acutely felt.

During the next ten years a large part of the relatively small uranium supply for nuclear power will be directed to the supporting inventory of nuclear fuel; beyond that the make-up to replace consumption is foreseen as rising to match and surpass the current world rate of production. By that time the atomic energy industry as a whole should be supported by the consumers of electric power but at present, in all countries and for a number of years to come, the young industry has the greater part of its costs furnished directly or indirectly through taxation. In an intermediate phase, capital advances made in anticipation of revenues from power consumers will be important.

Two government-owned Crown companies have the basic responsibilities for atomic energy in Canada; they are Eldorado Mining and Refining (1944) Limited, concerned with uranium supply, and Atomic Energy of Canada Limited (AECL) concerned with nuclear

* Prepared by Dr. W. B. Lewis, Vice-President, Research and Development, Atomic Energy of Canada Limited, Chalk River, Ont.

research and development, the design and construction of reactors for nuclear power and the production of radioactive isotopes and associated equipment such as cobalt-60 Beam Therapy Units for the treatment of cancer. For the greater part, the mining operations are conducted by private companies supported by export contracts that would have terminated in 1962, but are being revised so that some will be stretched out, without increase in total supply, to 1966.

Atomic Energy of Canada Limited has an eleven-man Board of Directors that includes individuals from private industry, public and private power companies, and the universities. The Company's major plant is near Chalk River, its Nuclear Power Plant Division is located near Toronto, and its Head Office and Commercial Products Division are both in Ottawa. The Company is collaborating with the Canadian General Electric Company Limited and The Hydro Electric Power Commission of Ontario in the building of a pilot atomic power plant, known as NPD-2 (Nuclear Power Demonstration), at Rolphton on the Ottawa River, 15 miles above the Chalk River plant. NPD-2 will generate 20,000 kw. and is scheduled for operation in 1961. AECL is also designing and constructing with the assistance of Ontario Hydro a full-scale nuclear power plant known as CANDU to supply 200,000 kw. This plant will be located at Douglas Point near Kincardine on Lake Huron and will be incorporated in the Ontario Hydro system. By agreement, Ontario Hydro will purchase the plant when it is in satisfactory operation.

To ensure that all other utilities are kept fully informed of the progress being made, the Government set up in 1954 an Advisory Committee on Atomic Power Development. This Committee, representing the utilities, meets periodically at Chalk River to assess the economic prospects of nuclear power throughout the country.

Because of the great pace of technological development in nuclear power throughout the world, AECL devotes a major effort to collaboration with many organizations. These include industrial firms and the scientific and engineering departments of universities in Canada and, through foreign government agencies and several international organizations, many technical groups in other countries. Close ties are kept with the United States Atomic Energy Commission and the United Kingdom Atomic Energy Authority, both of which have representatives permanently at Chalk River. More or less formal collaboration has been established also with the International Atomic Energy Agency, the Organization for European Economic Cooperation and Euratom as well as with India, France, Sweden, West Germany, Switzerland and Japan. Visits have also been exchanged with other countries.

During 1959, AECL announced that further expansion at Chalk River would be limited and that a site to receive the next major research and development facility had been selected in Manitoba on the Winnipeg River, about 65 miles from the city of Winnipeg. A notable event of the year was the commissioning of the first privately owned high-power experimental reactor in Canada at McMaster University, Hamilton, Ont. Information on Canadian nuclear reactors now established or under construction is given in the statement on p. 418.

Chalk River Project.—The Chalk River Project is a research and development establishment. Basic and applied research is carried on by about 200 professional scientists and engineers supported by 300 technicians devoted to research in nuclear physics, nuclear chemistry, radiobiology, reactor physics, radiation chemistry, environmental radioactivity, physics of solids and liquids, and other subjects, using as their primary facilities the two major reactors, NRX and NRU, the auxiliary reactors, ZEEP, PTR and Zed-2, the tandem Van de Graaff accelerator and analytical facilities such as a precision β -ray spectrometer, mass spectrometers, electron microscope, multi-channel pulse analyzers, automatic recorders, analogue and digital electronic computers. A large number of these scientists and engineers are engaged part or whole time on the development of nuclear fuel, on preliminary design and optimization calculations for nuclear power reactors, on solving technical problems encountered in the operation of the reactors, on

studies of potential accident conditions in and around reactors such as a burst in a pressurized water cooling system, on studying disposals of radioactive wastes, on design of instruments for reactor operation such as monitors for traces of normal water in heavy water, for radioactivity in flowing water, and on fail-safe and dependable control systems.

Other groups of engineers, scientists, technicians and tradesmen are engaged in operating and maintaining the reactors, accelerators, chemical plants, heavy water upgrading plants, workshops, nitrogen and helium liquefiers. Including the supporting services of finance, catering, library, plant hospital, fire protection, transportation, building maintenance, printing and reproduction and others, the total payroll numbers 2,300. Contractors' men and attached staff add more than 100. Compared with atomic energy establishments elsewhere the Chalk River plant is of medium size but, for its size, it covers a very broad range of activities.

Heavy-water-moderated research reactors are now becoming numerous and widespread throughout the world, but most of those operating at a high flux of neutrons use enriched uranium fuel (e.g., CP-5 near Chicago in the United States, DIDO and PLUTO at Harwell and DMTR at Dounreay in the United Kingdom, and EL-3 at Saclay in France); however, these enriched uranium reactors do not have as much space available for experiments as do those fuelled with natural uranium and so far NRX and NRU are the only heavy-water-moderated high-flux reactors using this fuel. The Canada-India Reactor (CIR) at Bombay, patterned on NRX is scheduled to come into operation during 1960.

The intense beams of neutrons provided by NRX and the still more intense beams from NRU have made possible studies that have attracted scientists from other centres. At the present time (January 1960) a team of Brookhaven (U.S.) and AECL scientists is using an NRU beam with a high-speed chopper and long flight path for neutron nuclear interaction studies, while another team with scientists from Harwell (U.K.) is using another system of choppers on another beam for studying details of the slowing-down action of moderators on neutrons.

In recent years a great technological advance has been based on the properties of nearly perfect crystals with controlled impurities, of which the transistor is the best known example. Studies of the energy changes of very-low-energy neutrons have greatly extended the knowledge of other such processes in solids and liquids where a number of atoms co-operate and an interpretation is possible in terms of quantized elastic waves or phonons. Pioneer work has been done in neutron-phonon interactions using neutron beams from NRX and NRU.

NRX and NRU share with other high-flux reactors such as the MTR at Arco, Idaho, the ability to produce certain isotopes whose formation requires that two or more neutrons react with the original atom in rapid succession to forestall radioactive decay. In this use they may in a few years be supplanted by still-higher-flux reactors planned in the United States and the U.S.S.R. For chopped neutron beams they may be supplanted by pulsed neutron sources driven by high-current accelerators, but for engineering testing of materials and especially of new types of fuel assemblies, NRX and NRU seem likely to remain unsurpassed. Since 1950, NRX has been used for fuel test irradiations in high-temperature water, and contributed to the design and operating conditions for fuel in the U.S. Naval reactors and the Pressurized Water Reactor at Shippingport. Similar irradiations have recently provided the basis for the design of fuel for the NPD and CANDU reactors.

NRU is the first high-power reactor in which the fuel is regularly changed at full power, a process that confers important advantages in power reactors. NRX is the first high-power solid-fuel reactor to operate without control rods, a feature that promises economies and safety in power reactors. Control is achieved by the level of heavy water maintained against a permanent drain by the speed of return by pumps.

CANADIAN NUCLEAR REACTORS IN OPERATION, UNDER CONSTRUCTION OR APPROVED FOR CONSTRUCTION

Name	Location	Date of Start-up	Power	Fuel	Moderator	Coolant	Use
Zero Energy Experimental Pile (ZEP).....	Chalk River, Ontario	1945	100 w.	Natural uranium metal or oxide	Heavy water	--	Lattice experiments
National Research Experimental (NRX).....	Chalk River, Ontario	1947	40, 000 kw.	Natural uranium metal	Heavy water	Ordinary water	Research and isotope production
National Research Universal (NRU).....	Chalk River, Ontario	1957	200, 000 kw.	Natural uranium metal	Heavy water	Heavy water	Research and plutonium and isotope production
Pool Test Reactor (PTR).....	Chalk River, Ontario	1957	100 w.	Enriched uranium alloy	Ordinary water	Ordinary water	Reactivity and absorption measurements
Toronto University Sub-critical Reactor.....	Toronto, Ontario	1958	--	Natural uranium metal	Heavy water	--	Research and teaching
McMaster Nuclear Reactor (MNR).....	Hamilton, Ontario	1959	1, 000 kw.	Enriched uranium metal	Ordinary water	Ordinary water	Research
ZED-2.....	Chalk River, Ontario	1960	100 w.	Natural uranium metal or oxide	Heavy water	--	Lattice experiments
Canada-India Reactor (CIR).....	Bombay, India	1960	40, 000 kw.	Natural uranium metal	Heavy water	Ordinary water	Research and isotope production
Nuclear Power Demonstration (NPD-2).....	Rollpton, Ontario	1961	20, 000 kw. (electricity)	Natural uranium oxide	Heavy water	Heavy water	Power demonstration
Canadian Deuterium-Uranium (CANDU)...	Douglas Point, Ontario	1964-65	200, 000 kw. (electricity)	Natural uranium oxide	Heavy water	Heavy water	Power

Nuclear Power Prospect.—The generation of electricity by nuclear power on a competitive economic basis is expected to be established by the type of reactor now being designed by the Nuclear Power Plant Division of AECL at Toronto.

This promise rests on the attainment of very-low-cost fuelling by an extremely simple system tested over many years by experiments in the NRX reactor. The fuel will be uranium dioxide specially prepared from natural uranium entirely in Canada. A wide range of tests in hot channels in the NRX reactor at heat ratings and energy yields in excess of those required has established that this oxide fuel is incomparably more dependable than the uranium metal fuel for which the NRX and NRU reactors were designed. No provision for reprocessing the irradiated fuel is involved, for, by careful attention in the reactor design to minimizing any waste of neutrons, an energy yield of over 9,000 thermal megawatt-days is expected from a ton of uranium before it is discarded. This results in a prospective fuelling cost of about 1 mill (0.1 cent) per electric kilowatt-hour, to be compared with about 3 mills from coal at \$8 per short ton.

Canada has access to such an abundance of coal, oil and natural gas that the competitive cost level for electric power is lower than in many other countries. Nuclear power plants of the types now under construction in the United Kingdom and the United States have been assessed as unable to reach a low enough cost level, at least until several successive plants have been built and operated to discover where economies are possible. Plants of the CANDU type do not promise to be significantly cheaper in initial outlay, but the fuelling cost can be so much less that meeting the competitive target is a very real prospect.

The low fuelling cost derives as much from the details of the design proposed as from the general type of reactor chosen. Some of the important features seem worthy of mention. The full-scale plant will generate 220 megawatts with a steam-cycle efficiency of 32.8 p.c., so the reactor has to supply 670 thermal megawatts to the steam-raising plant. The reactor is essentially a tank of heavy water, 20 ft. in diameter and 16.5 ft. long, lying horizontally. It is penetrated by 316 fuel channels parallel to the axis on a 9-inch-square lattice. Each channel is a zirconium-alloy pressure tube of 3.25 in. inside diameter and about 0.17 in. thick. The fuel consists of bundles of 19 rods, 0.6 in. diameter, 19.5 in. long, made of dense uranium dioxide in thin zirconium-alloy tubes. Heat is taken from the fuel directly by heavy water that passes at 560°F. to the steam boiler, where normal water is raised to saturated steam at 483°F. and 560 psi. The heat developed in the heavy-water moderator that is in the tank outside the fuel channels is not directly used and amounts to about 40 thermal megawatts. The over-all net plant efficiency is then 28.2 p.c. These details show that the design represents a very considerable advance over that originally conceived in 1956, and the improvement bears promise that continued progress will lead to costs well below the economic target. As examples of the advance, it may be noted that for the same electric power output, the reactor power has been brought down from 790 to 710 megawatts and the length of fuel rod from 86 to 30 kilometres. The prospective fuelling cost has dropped from 1.85 mill/kwh. to 1.0 mill/kwh. On the other hand, no over-all reduction has been achieved in the capital cost estimates which remain in the range \$300 to \$400 per electrical kilowatt for the whole plant. No reduction is expected until manufacturing experience has been gained that can be used in future construction.

These figures will serve to explain why the first plants seem to find economic application in Canada only in the Ontario system, where annual charges on capital are low and coal has to be imported and costs about \$8 per short ton. Moreover the demand for electricity in Ontario is growing at more than 200 megawatts capacity per year. To build reactors for lower powers saves little in the cost, so the cost per kilowatt rises and becomes uneconomic. When confidence has been gained from the early plants, higher powers seem likely to be attempted and 400 electrical megawatts from one reactor may be attained.

Operating experience with the NRX and NRU reactors at Chalk River and with the many other types throughout the world has served to emphasize the extreme difficulty and costliness of making even minor operating repairs in the presence of the extremely

high levels of radiation that are encountered around reactors. Directly and indirectly, this is responsible for the current hesitation to construct a number of large plants that for economic power cost no less than \$40,000,000 or \$50,000,000 each. With every new design it is necessary to acquire operating experience before the reliability and availability can be effectively estimated. Experience with defective fuel has been deliberately sought at Chalk River, because this is one of the difficulties most likely to be encountered. Appropriate techniques of locating the defective element, removing it and cleaning up the released radioactive fission products, have been established and practised; at the same time fuel designs and ratings have been studied which lead to least difficulty in these operations. Experience of mechanical failures of control rods has lent weight to reactor designs such as NPD-2 where control rods are not needed. Temperature changes are liable to provoke mechanical failures, so design is aimed at keeping the reactor at power for all essential operations including refuelling and complete maintenance testing and readjustment of instruments and working parts of the control system.

These considerations lead to a vicious circle, for the quickest way to achieve reliability is to construct and operate a number of plants following these design principles, but until such plants have operated satisfactorily utilities are unwilling to take the risk of lost time for repairs. The same principles hold throughout the world. For example, the United Kingdom is following a program based on the Calder Hall type of reactor developed, not by a utility company, but by the government to serve a military requirement. Italy is purchasing three power reactors—one from the United Kingdom, one from the United States based on the Shippingport and Yankee reactors, and one from the United States closely following the Commonwealth Edison Dresden plant. Canada is pioneering another pattern financed by the government, and working at Chalk River to develop technical knowledge and experience that will give confidence to the utilities. The performance of the demonstration reactor (NPD) will tell whether the sought-for reliability has been achieved so that utilities can take over.

Because the CANDU type of reactor is suitable only in large units, AECL is undertaking to study another type of reactor proposed by the Canadian General Electric Company that should have a lower capital cost. This is also a heavy-water-moderated reactor, but the heat is taken from the fuel by an organic liquid specially chosen for a high boiling point and minimum decomposition by radiation. This is a hybrid design that should utilize the Chalk River experience with heavy water and uranium oxide fuel and the experience of the organic liquid developed in the United States as a coolant and moderator for a nuclear reactor. Development of metals that are suitable for use in such a reactor is required and may take a few years to effect.

A third type of power reactor is also under study: again heavy-water-moderated and uranium-oxide-fuelled, but the coolant is normal steam at high pressure. The steam would be superheated in the reactor. New materials are required also for this design and their development may be lengthy. Such a reactor would have a higher efficiency than the CANDU type and would be suitable for large sizes.

Section 3.—Space Research in Canada*

There is an active interest in space science in Canada. This is because research in the physics of the upper atmosphere and in nearby space (where the atmosphere merges into interplanetary space) has been stimulated for many years by Canada's unique position in relation to the axis of the earth's magnetic field. This geographic position also signifies a certain responsibility for Canadians to carry out research in their own northern areas as well as to co-operate with others conducting scientific work in or over Canadian territory.

Until the advent of space sounding rockets and satellites, activities were confined to indirect observations from the ground, but with the development of new techniques and the growing capabilities of Canadian science a comprehensive space science program is

* Prepared by Dr. D. C. Rose of the National Research Council of Canada, Ottawa.

being developed in Canada. The program is small compared to that of satellite-launching countries but it will contribute to the advancement of knowledge made possible by the development of space vehicles. Canada's program consists of the launching in Northern Canada of sounding rockets carrying instruments, co-operating with United States groups in their extensive program in Canada, assisting in the tracking of satellites, and in the design and construction of scientific experiments to be launched in a United States satellite sometime in 1961.

The technological developments necessary to put satellites in orbit or even to launch rockets that will penetrate the atmosphere are considerable. The scientific achievements in producing these have been great but from the point of view of space science the rocket or satellite is nothing more than a vehicle and in fact is usually spoken of as such. It was developed for military purposes though it is important to note that several of the vehicles used in space science by various countries were designed solely for carrying scientific instruments and these vehicles have no practical military application.

Though there is keen rivalry between the United States and the Union of Soviet Socialist Republics to get a man into space and this rivalry appears on the surface to be political in motivation there are sound scientific reasons for so doing. With a man to operate them, scientific instruments become much more versatile, and objectives can be changed in flight using judgment that still cannot be built into a machine. No matter how complicated a machine is, judgment in programming cannot be built in where the features to be judged are not known.

An example of the advancement of scientific knowledge that can be achieved by penetrating the earth's atmosphere is a study of the radiation that reaches the earth's outer atmosphere from the sun or from outer space. For simplicity, included in the term "radiation" are both electromagnetic waves like light and clouds of rapidly moving particles such as the nuclei of atoms. The energy of these can be measured in the unit so commonly used by physicists known as the electron volt. It is a very small unit requiring 6.24×10^{18} per second to be equivalent to one watt, but the number of particles is sometimes very high. Using this unit one refers to the energy per quantum of light if electromagnetic in nature, or per single particle if a particle cloud is being considered. The realized energy is, of course, the energy per quantum or particle multiplied by a density of the quanta or particles. The quantum of light having the highest energy that can penetrate the atmosphere is about four electron volts. The energy of the most energetic known cosmic ray is about one billion times one billion electron volts (where one billion = 10^9). None of these radiations or particles in this enormous range of energies can penetrate the atmosphere without interacting with it in a way that changes the identity of the primary radiation. In fact, radiation in the range from four electron volts to about two billion electron volts cannot penetrate the atmosphere to sea level at all. This means that the atmosphere is completely opaque to all ultra-violet light, X-rays and low energy cosmic rays. Until the advent of rockets and satellites the existence of such radiation from the sun or sky could only be inferred by indirect measurements on some of the effects they produce, such as faint light from the night sky and aurora.

This is just an example of the advances in pure science that can be made by carrying instruments in rockets and satellites. Practical applications in expanding available radio frequencies for communication and for improving meteorological forecasting could be explained in detail but both are associated with the need for a better knowledge of the radiations mentioned above and also the chemical composition and physical state of the atmosphere at levels above about 30 miles.

The earth's atmosphere gradually merges into the atmosphere of the sun, there being no region in the environment where the density of matter is nearly as low as it is believed to be in interstellar space. This is so, even though the density of this matter is very much lower than the best vacuum that can be produced in the laboratory.

The solar atmosphere in which the earth moves is quite turbulent and the motion and the density are constantly changing. The solar gas is very hot and electrically conducting. Clouds of solar gas and a flux of energetic particles from space interact with the

earth's magnetic field. It is this interaction that makes space research in Canada so important, because the axis of the earth's magnetic field is tilted with respect to the earth's axis in such a way that the northern region where the magnetic lines of force are nearly vertical is in Northern Canada. This interaction with the magnetic field causes the ionosphere disturbances that are responsible for blackouts in radio communication as well as the well-known aurora.

Canada's interest in space research is, therefore, mainly in this region at heights from about 30 to 200 miles. This is the region where rockets serve better than satellites as the instrument-carrying vehicle. Such interest is by no means new. Studies of the ionosphere using the technique of reflected radio waves have been conducted for years, and also studies of the aurora both by spectroscopy of the light it emits and by the reflection of radio waves from the auroral discharges. Scientific research groups in the University of Saskatchewan, the Defence Research Laboratories and the National Research Council have made important contributions.

The importance of direct measurements at high geomagnetic latitudes led the United States in 1956 to establish a comprehensive rocket-launching facility at Fort Churchill in Manitoba as part of their International Geophysical Year program. This was a purely scientific effort even though the operation of the rocket range was by the United States Army and it was established at a Canadian Army Base under Canadian Army supervision.

The United States groups using the range were very generous in making the facilities available to Canadian scientists and in treating it as a joint undertaking. The Canadian contribution during the IGY, though small compared to the total operations at Churchill, was appreciable in that the operation would have been very difficult and much more expensive had it not been for the existence of the Army Base and the Defence Research Board's Northern Laboratory. Meteorological assistance was also given by the Department of Transport. During the IGY, scientists of the Canadian Armament Research and Development Establishment built experiments in two rockets launched at Churchill designed to study certain visible and infrared radiations produced in the upper atmosphere.

After the close of the IGY (Dec. 31, 1958) a limited program was continued as a joint operation. The United States continued to operate the rocket-launching facility but several Canadian projects have been undertaken. It was a natural development that Canada's record of research in the ionosphere should lead to suggestions to extend measurements using satellites and rockets. The invitation of the American Space Science Board of the National Academy led the Defence Research Board's Telecommunications Establishment to suggest an experiment to be carried in a satellite wherein the ionosphere was observed from above rather than from below. One common technique on the ground is to observe echoes of short radio pulses directed upward and reflected downward from the ionosphere. This is known as vertical sounding. The same technique from a satellite was suggested but with the radio pulse transmitted from above and reflected upward. The project has been called the "Topside Sounder" and the instruments designed and built by Canadian scientists will be launched in 1961.

During 1959 two Aerobee rockets given to Canada by the United States were used for Canadian experiments. Experiments designed to measure electron density in the ionosphere and the intensity of low energy cosmic rays were carried out successfully. The Canadian Armament Research and Development Establishment had been working for some time on a solid fuel propellant for large rockets. Their results reached a stage during 1959 where a propellant test vehicle could be launched at Churchill and four such rockets were launched late in 1959. While the development of propellants is obviously a military objective this particular investigation can result in the construction of a very good rocket for scientific purposes which will carry 150 lb. of instruments up to nearly 200 miles. Experiments planned for 1960 and 1961 will use a rocket of Canadian design and manufacture.

The plans for 1960-61 include Canadian university research groups for the first time. The National Research Council formed an Associate Committee on Space Research in 1959, which will co-ordinate experiments proposed and carried out by university groups and the NRC laboratories. It will make arrangements for supplying the university groups with rocket nose cones in which they can build experiments and then have them launched at Churchill.

At the request of the National Aeronautics and Space Administration in the United States, a satellite tracking station is being built near St. John's, Nfld. While this is one of a world-wide network of tracking stations of United States design and the equipment is being supplied by them, it will be operated as a Canadian station. In the early days of Soviet satellites a great deal of tracking—visually, photographically and by picking up radio signals—was done in Canada. Tracking by visual and photographic means, if well organized so that the satellite can be located accurately, is still of considerable value and amateur groups who are interested can make important contributions.

Canada is also taking an active part in international organizations on space research, having membership in the Special Committee on Space Research (COSPAR) of the International Council of Scientific Unions (ICSU) and in the United Nations Committee on the Peaceful Uses of Outer Space.

COSPAR being a committee of the International Council of Scientific Unions is purely scientific in nature. Membership in it is open to countries having space science programs which are recognized by the International Council of Scientific Unions. International Scientific Unions, and special committees thereunder are for the advancement of scientific activities and the representation on them is from National Academies or National Research Councils rather than from governments. Despite the non-political character of COSPAR, political questions arose in its formation. Its original constitution called for membership from International Unions and from National Academies in countries with space science programs. At the first meeting after an organization meeting, the selection of representatives from the International Unions was accidentally such that the U.S.S.R. had only one voting member while the U.S. and the U.K. had three or four each. The U.S.S.R. delegate objected to such a situation and many members felt he had some justification. It took about a year of negotiations to rectify this and a successful meeting of COSPAR was held in Nice, France, in January of 1960. A symposium on space science was organized in conjunction with the meeting and three papers were presented by Canadian scientists.

The United Nations Committee on the Peaceful Uses of Outer Space was first formed as an ad hoc Committee by the Thirteenth General Assembly. The Committee consisted of 18 countries of which Canada was one. Political problems arose there again because of Soviet disagreement over membership and five member nations refused to take any part in it. Nevertheless the Committee met in 1959 and produced an informative and substantive report. Much of the Committee's work was done by two sub-committees, one technical and the other legal, each member country having representation on both. A Canadian scientist was elected chairman of the technical committee. The Fourteenth General Assembly of the UN accepted the report and formed a new committee of 24 nations again including Canada.

In many countries Astronautical Societies have been formed. Some of these require professional qualifications and some are for interested amateurs. The groups have an international organization known as the International Astronautical Federation. These organizations are not government-sponsored but form an important link in public and commercial interest in space. There are at least three such groups active in Canada, the Astronautical Society of Canada with headquarters in Montreal, the Canadian Astronautical Society with headquarters in Toronto and the Astronautical Section of the Canadian Aeronautical Institute.

Section 4.—Other Scientific and Industrial Research Facilities

Aside from the research facilities and activities covered in Sections 1, 2 and 3, Canadian research is carried on by various federal agencies, provincial organizations, universities and industries. Several provinces in Canada have established provincial Research Councils to stimulate and support research on problems having special provincial significance. The universities, of course, form an extremely important part of the Canadian pattern of research. Much of their work is along fundamental lines but practical problems are not neglected, especially those of regional interest.

All three types of institutions—federal, provincial and university organizations—have an interest in problems of industrial significance: this is part of the current Canadian pattern of research. Though many Canadian industries now possess research facilities—some of them quite extensive—the main bulk of industrial research to date has been done under government auspices.

Thus the unique problems of the country, particularly its large area coupled with a small population, have led to a typically Canadian organization of research, of which a very strong associate committee system is perhaps the most distinctive feature.

Subsection 1.—Federal Organizations

Although research by industrial concerns has been slow to develop in Canada, government research has expanded rapidly, at first because of the need for speeding up the production of raw materials, which were for many years the basis of Canada's export trade, and secondly because of the more recent interest in the processing of these raw materials and the necessity of meeting the needs of national defence. Federal agencies involved in research include the Departments of Agriculture, Fisheries, Mines and Technical Surveys, National Defence, National Health and Welfare, Northern Affairs and National Resources, and Trade and Commerce; the National Research Council; and Crown corporations such as Atomic Energy of Canada Limited. A system of committees, with nation-wide representation, eliminates unnecessary duplication of work from these national research organizations.

The scientific work of the Department of Agriculture is described in Chapter IX of this volume, the work of the Defence Research Board in Chapter XXVI, specialized work in scientific forest research in Chapter X, scientific services concerned with Canada's mineral resources conducted by the Department of Mines and Technical Surveys in Chapter XI, investigational work of the Department of Fisheries in Chapter XIII, research of the Canadian Wildlife Service of the Department of Northern Affairs and National Resources in Chapter I, the work of the National Research Council at pp. 408-415 and atomic research at pp. 415-420. The activities of the other federal agencies engaged in research are described briefly in the following paragraphs.

Department of National Health and Welfare.—The Department of National Health and Welfare supports both intramural and extramural research programs. Within the Department, the Food and Drug Directorate, Laboratory of Hygiene, Occupational Health Laboratory and various clinical services are engaged in scientific research in their respective fields. Special studies and surveys are conducted in social and medical economics by the Research Division. The extramural program consists of grants in aid of medical research at universities, hospitals and other research institutions from funds under the National Health Program. The Public Health Research Grant provides over \$500,000 per annum, with allocations from the Mental Health, General Public Health, Tuberculosis, Cancer, Child and Maternal Health and Crippled Children's Grants making up approximately \$2,000,000 additional funds. To co-ordinate medical research programs, meetings are held by representatives of the National Research Council, Defence Research Board, Department of Veterans Affairs, National Cancer Institute and the Research Advisory Committee of the Department of National Health and Welfare. These have provided a reasonably clear definition of the field of interest of each organization and have minimized uneconomical overlapping.

Grain Research Laboratory.—Rapid development of grain production in Western Canada led to the passing, in 1912, of the Canada Grain Act. This Act is administered by the Board of Grain Commissioners, which reports to Parliament through the Minister of Trade and Commerce. The Board is responsible for control of the weighing, grading and warehousing of Canadian grain. Soon after its establishment, the Board encountered problems that required scientific study and a Grain Research Laboratory was established at Winnipeg, Man., in 1913.

The Grain Research Laboratory, with a staff of 55, is the main centre of research on the chemistry of Canadian grains. It is well staffed and equipped to provide the service required to help maintain and expand domestic and foreign markets for all types of grain. The Laboratory collects and tests samples of various crops to obtain information on the current quality of all grains shipped during the crop year and prepares, annually, certain information required by the Board for administering the Canada Grain Act. Fundamental research is also undertaken; the program is directed toward increased understanding of what constitutes quality in cereal grains and toward improving the methods of assessing quality.

Subsection 2.—Provincial Organizations

The fact that only a few provincial research organizations exist does not indicate lack of interest in research by the provinces. Most provincial governments have university laboratories to consult, particularly about local industrial and agricultural problems, and many individual departments have facilities for research in their particular fields of endeavour or assist research through the provision of financial aid to students working in those and other scientific fields. Agriculture is particularly well covered because of its importance as an export industry but the provinces are also intensely interested in their other natural resources. Their efforts in the fields of agriculture, forestry, mining and fisheries are outlined in the Chapters dealing with those subjects (see Index).

Nova Scotia Research Foundation.—This body was created by the Government of Nova Scotia in 1946 to give its people additional scientific and technical assistance in finding new and better ways to utilize the resources of the forest, the sea, the farm, the mine and the process industries. To this end it seeks to correlate and further scientific work on local problems and available resources. It assists universities, colleges, research groups, industries, provincial and federal departments and individuals by loans of equipment, grants, scholarships, laboratory and summer assistants, library, cartographic, photogrammetric and translation services, and technical information. It has supported or collaborated in work on breeding new varieties of plants and root nodule bacteria; on antibiotics, poultry, blueberry culture, coal-burning equipment, the constitution and gasification of coal, the non-destructive testing of mine equipment, the utilization of anhydrite, diatomite, fish waste, gypsum, seaweed, slag, slab wood and fertilizing materials. It has conducted geophysical, geological, air pollution, and seaweed surveys as well as forest aphid, forest ecology and genetic studies and assisted studies on the nutrient cycles of lakes, on X-ray crystallography, and on pressures in underground strata. Its Geophysical Division is equipped to undertake all types of magnetometric, gravimetric, resistivity, seismic and electromagnetic explorations. The Technical Services Division provides free technical information to industries in the province and offers them research and development services and facilities in the fields of physics, chemistry and engineering, including operational engineering. During the summer of 1959, 75 people were engaged in 28 research projects.

Saskatchewan Research Council.—The Saskatchewan Research Council was established in 1947 for "research and investigation in the physical sciences as they affect the economy of the Province of Saskatchewan, and such particular matters as may be brought to its attention from time to time by the Lieutenant-Governor in Council". The term 'physical sciences' is given a broad interpretation to include biology, geology and engineering. Within this field the Council undertakes basic and applied research.

Up to the present the Council has functioned mainly by granting funds for approved research projects and awarding scholarships at the University of Saskatchewan. It has also conducted a technical information service with the assistance of the National Research Council. It has recently entered a new phase and, in addition to its former activities, employs a full-time staff in a new laboratory building located on the University grounds.

Research Council of Alberta.—The Province of Alberta set up a Scientific and Industrial Research Council in 1921, the promotion of mineral development within the province being the chief purpose leading to its establishment. The Council operates under an Act somewhat similar to that setting up the National Research Council and is financed by provincial government appropriations. The present program is directed to the application of basic and applied science toward the development of the natural resources of the province. Investigations include studies on coal, petroleum, natural gas, geological research and surveys, soil surveys, hail studies, irrigation and highway research. The Council maintains a gasoline and oil testing laboratory and has a group of industrial engineers to provide scientific information to developing industry. The Council laboratories, located on the University of Alberta campus, include a \$750,000 research laboratory and pilot plant provided by the Province of Alberta in 1955. The laboratories work in co-operation with the scientific departments of the University and the operations of the organization are controlled by a council of ten individuals representative of government, the University and industry. The various research projects are under the immediate supervision of advisory committees and the chairmen of these committees form the Technical Advisory Committee of the Council, the body responsible for the integration and operation of the scientific aspects of the program.

British Columbia Research Council.—The British Columbia Research Council, under the sponsorship of the provincial Department of Industrial Development, Trade and Commerce, provides a scientific and engineering staff with laboratories on the campus of the University of British Columbia. The objective is to enable even the smallest firms to improve their competitive position in Canadian and world markets by the use of the most up-to-date scientific and technical knowledge. The Council provides three classes of service: a free information service in collaboration with the National Research Council; assistance to specific firms at cost where information cannot be supplied from existing knowledge; and, at the Council's expense, research on problems of general value to the industrial development of the province.

The Ontario Research Foundation.—The Ontario Research Foundation, established in 1928, is a non-profit applied-research organization financed initially by an endowment fund composed of subscriptions from manufacturers, corporations, private individuals, and a grant from the provincial government. Most of its current income is derived from contract research and annual provincial government grants. The Foundation carries on research to assist agriculture and industry in developing the natural resources of the province. A study has been made of the physiography and climate of southern Ontario and also of the parasites found in wildlife in this province. Many investigations have been undertaken in the industrial field and the Foundation is well equipped to work in engineering and metallurgy, physics, textiles, chemistry and biochemistry. The services of the Foundation are at the disposal of industry on a fee basis, and consultative services, testing, short-term studies and long-term investigations have been undertaken for hundreds of firms. The work has resulted in better products and in more efficient processing. The Foundation administers a grant from the provincial government to support postgraduate scholarships and scientific research in the universities of Ontario. It provides an information service for industry, which is supported by the Ontario Department of Planning and Development and the National Research Council.

The Hydro-Electric Power Commission of Ontario.—The Research Division of Ontario Hydro, with a staff of 300, provides testing, investigation and research services for all phases of the utility's engineering design, construction work, and system operation

and maintenance. The Division maintains close liaison with other research organizations and power utilities, and staff members participate in the committee work of major technical societies and standardizing associations.

Electrical investigations pertain to methods of generating, transmitting, distributing and utilizing power, and to improvement in equipment for these purposes. Among the topics studied are transmission at extra-high voltage; problems of electrical insulation; system operation and control, and system protection against lightning; communications and telemetering; illumination; and power metering. Attention is given to the performance and efficiency of power equipment, to improved measuring techniques, and to means of minimizing the hazards of electric shock.

Among the structural and mechanical topics studied are the following: soil mechanics as related to foundations, roads and earth dams and dykes; the physical properties of structural components and of numerous items such as conductor joints and line hardware; the mechanical performance and safety features of equipment and various types of machines; metals and metallurgy; welding materials, techniques and applications; atmospheric and underground corrosion of metals; stresses in materials and structures; noise and vibration conditions; and a variety of problems associated with the design, construction and maintenance of concrete structures, the application of masonry materials, and the production, placement and quality control of all concrete used.

In addition to chemical analyses and tests performed on a wide range of materials and products purchased, chemical research work is conducted with regard to such subjects as wood preservation, plastics applications, protective coatings, brush and weed control, lubrication, liquid electrical insulants, water treatment, thermal insulation, and corrosion prevention.

Other studies contributory and supplementary to the main branches of work are carried on in the fields of physics, biology, petrology and mathematics. Operations research studies are used in determining optimum policies and procedures in vehicle replacement, inventory control, reserve transformer capacity and economical power dispatch.

Subsection 3.—Medical Research

Medical Research Facilities.*—Support for medical research is provided by the federal and provincial governments, by private foundations or corporations, by voluntary agencies which raise money by public subscription, and by universities and hospitals. From these sources there are available (a) research fellowships for training, (b) grants-in-aid for assistance in problems of a fundamental or clinical nature, (c) salaries for trained personnel, and (d) the necessary capital and running expenses for investigations which are of particular interest to governments, hospitals or pharmaceutical houses.

The Departments of National Health and Welfare and National Defence maintain establishments in which research is done in well-equipped laboratories with highly trained personnel. The Department of Veterans Affairs encourages its staff to do research in its own hospitals; much of this concerns chronic illness, such as arthritis, atherosclerosis, metabolic and nutritional derangements (see pp. 332-334).

Most of the fundamental medical problems are studied in medical schools through the system of grants-in-aid. Funds from the Federal Treasury are provided through the National Research Council, the Defence Research Board, and the Department of National Health and Welfare. The National Research Council supports mainly research in the basic medical sciences—anatomy, physiology, biochemistry, pharmacology, bacteriology, pathology, and experimental surgery—but approximately one-quarter of its grants are for clinical investigations. The Defence Research Board makes grants for studies particularly related to problems of defence, such as shock, the preservation of blood and the use of blood substitutes, the effects of low temperatures, etc. The Department of National Health and Welfare provides funds for research, available on the recommendation of

* Prepared by Dr. J. Auer, Assistant Director, Division of Medical Research, National Research Council, Ottawa.

provincial departments of health, in the following fields: public health research, tuberculosis control, child and maternal health, mental health, and general public health. It also gives assistance to the Canadian Arthritis and Rheumatism Society (which obtains other support by public subscription) and to the Ontario Heart Foundation (which derives its other resources from the Ontario Provincial Government). In addition the Department of National Health and Welfare makes available to the provinces cancer grants, out of which the provinces may supplement the funds for research which the National Cancer Institute receives from the Canadian Cancer Society. Thus the Department of National Health and Welfare is the Canadian agency that gives the greatest support to extramural research in medicine; its interest is primarily in those problems that have a direct bearing on the health of the nation rather than in fundamental research.

Universities receive funds for research also from provincial branches of the Canadian Cancer Society and from such government foundations as the Ontario Cancer Treatment and Research Foundation and the Alcoholism Research Foundation, from fraternal societies and clubs such as the Rotary Club, from the J. P. Bickell Foundation, the Atkinson Charitable Foundation, the Canadian Life Insurance Officers Association, the Muscular Dystrophy Association of Canada, the Banting Research Foundation, the Multiple Sclerosis Society, pharmaceutical companies, etc. At several universities, individual investigators also receive grants in aid of research from various granting bodies in the United States of America.

With help from these diverse sources, active research programs are in progress in every one of the twelve Canadian medical schools. In certain of these there are special departments devoted to research, e.g., the Departments of Medical Research at the University of Toronto and at the University of Western Ontario, and the Department of Investigative Medicine at McGill University; these departments contain graduate students who work to higher degrees. With few exceptions, departments designed for undergraduate instruction are active in research; a majority provide graduate instruction as well, in which the students are maintained on research fellowships or grants.

Notable contributions to medical knowledge are made every year by Canadian scientists, but space permits the mention of only a few fields: studies on epilepsy at the Montreal Neurological Institute; functions and interrelations of areas in the brain and brain stem and studies in neurophysiology and neurochemistry at McGill University, the University of Montreal, the University of Ottawa, the University of Western Ontario and Laval University; endocrine and metabolic studies at McGill University and the Universities of Montreal, Toronto, Western Ontario, British Columbia and Manitoba; anticoagulants at the University of Saskatchewan; atherosclerosis and hypertension at McGill and Queen's Universities and the Universities of Western Ontario, Toronto and British Columbia; hypothermia at the University of Toronto; surgery of heart and blood-vessels at McGill University and the Universities of Toronto and Montreal, and the Montreal Institute of Cardiology; tuberculosis at Dalhousie University, the Institute of Microbiology, Montreal, and the Connaught Medical Research Laboratories, Toronto; mental health studies at the Nova Scotia Department of Health, the Allan Memorial Institute at McGill University, the University of Toronto, Regina General Hospital and the University of British Columbia; virology, including poliomyelitis, at the Institute of Microbiology, Montreal, the Sick Children's Hospital, Toronto, and the Connaught Medical Research Laboratories; bacteriology, immunity and hypersensitivity at McGill University, the University of Montreal, Queen's University, the University of Western Ontario and the University of Toronto; cancer in all the medical schools.

Connaught Medical Research Laboratories.—The Connaught Medical Research Laboratories, University of Toronto, were established for the advancement of preventive medicine and public health through research and through the preparation of biological and other products essential in prevention or treatment of certain diseases. The Laboratories render a medical public service to all the provinces of Canada and, to an extent, to countries abroad. This service was initiated when the preparation of diphtheria antitoxin was undertaken in the Department of Hygiene at the University in an effort to reduce

the death toll from diphtheria in Canada. At the same time, the Department initiated investigations into this and other diseases. Since then, research activities have constantly expanded and today more than 70 studies are being conducted in the Laboratories.

The research program of the Laboratories concerns the broad field of preventive medicine. By including the study of certain animal diseases, particularly those which are transmissible to man, and through preparation of related products, the Laboratories are serving both the medical and veterinary professions.

The research projects are extensive and include studies of bacterial and virus diseases, investigations in immunology, epidemiology, physiology, biochemistry, and in other fields related to preventive medicine. These undertakings are maintained in part through the distribution of products, the furnishing of which constitutes an important public health service. Also important to the advancement of public health is the assistance rendered by the Laboratories in the postgraduate teaching of medical officers of health, nurses, dentists, veterinarians, and other professional personnel. From the inception of the Laboratories in 1914, members of the staff have been closely associated with postgraduate teaching in public health. In 1924, through the beneficence of the Rockefeller Foundation and with the co-operation of the government of the Province of Ontario, the School of Hygiene was established. This provided greatly enlarged teaching facilities and also extended the participation of the Connaught Medical Research Laboratories in the work of training public health leaders.

On the University campus the College Division of the Connaught Medical Research Laboratories and the School of Hygiene share one building, permitting of joint use of research and laboratory facilities of the two institutions, and promoting a close and mutually advantageous relationship. Here also the production of insulin and other glandular products is undertaken. On Spadina Crescent in Toronto, the Spadina Division of the Laboratories provides accommodation for much important work including the production of penicillin and research in the field of antibiotics. Additional facilities are provided near Toronto at the Dufferin Division and include a 145-acre farm property with modern laboratory buildings and quarters for animals.

Through the organization of the Western Division in the University of British Columbia, the Connaught Medical Research Laboratories have shared in the development of an important program of research in preventive medicine on the Pacific Coast.

Thus for over forty years the Connaught Medical Research Laboratories, with the co-operation of the medical profession and the official public health authorities, have contributed in steadily increasing measure to the advancement of research and public health in Canada.

The Banting Research Foundation.—The Banting Research Foundation supports the work of the Banting and Best Chair of Medical Research in the University of Toronto and aids medical research throughout Canada by making grants-in-aid to those who submit problems of sufficient medical interest to the Board of Trustees. The Board meets and makes grants usually three times a year, around June 1, Oct. 1 and Feb. 1. Five members of the Board of Trustees are appointed by the Board of Governors of the University of Toronto and the Alumni Association of the University of Toronto, and these five members appoint two other Trustees, then the seven members appoint an eighth Trustee. The address of the Honorary Secretary-Treasurers is 500 Sherbourne Street, Toronto 5, Ont.

Subsection 4.—University Research

Although there is considerable diversity of purpose in the aims of Canadian universities and colleges, they may be generally described as (1) the diffusion of knowledge through some teaching, extension and evening classes, and written reports; (2) the preservation of knowledge with some reorganization from time to time; and (3) the extension of the boundaries of knowledge essentially through research.

There are, of necessity, differences in emphasis in carrying out these aims. The undergraduate courses are designed to provide broad basic understanding in a variety of subject fields, to be followed by a more extensive and intensive application in one or

two of them. Graduate schools provide for a broader and deeper penetration and understanding in one field, supplemented perhaps with more general knowledge in related fields. Seminars, directed study, and individual research usually form a considerable part of advanced study. Most of these courses provide for practice in the research methods of the discipline—whether through experiment, questionnaire, logic or statistics—in order to prepare students capable of adding to present knowledge. This applies to the closely knit professional fields as well as to the more general branches.

For many years research in the universities was directed towards obtaining knowledge for its own sake and was considered pure research. Later it was recognized that the conclusions of such research provided the basic information for applied science and before long the universities, because of their unique position in having trained specialists and equipment, were involved in both basic and applied research. During World War II they were encouraged to undertake emergency and other contractual research and since then the trend towards broadening the field of research, increasing the capacity of universities to educate advanced students, and procuring large-scale costly equipment has shown rapid advance. This has created new problems but has provided even greater opportunities for undertaking sizable projects which could not have been attempted otherwise and has thereby tended to knit the university into the very warp of industry.

Research conducted in the universities falls into three broad categories: projects undertaken by the student under the guidance of a professor or committee to meet requirements for an advanced degree; research undertaken by the professor, which may be of a more or less continuous nature; and larger research projects undertaken co-operatively on a faculty or interfaculty basis in university laboratories or in such specialized institutions connected with the university as medical research laboratories, institutes of microbiology and hygiene, science service laboratories and faculties of agriculture.

Some idea of the increase in research undertaken by Canadian universities may be obtained from a comparison of the situation in 1919 with that in 1959. In the former year, two universities—Toronto and McGill—offered graduate courses beyond the master's degree and graduated 11 students; in 1959 Ontario had four, Quebec three and six other provinces each had one major university with graduate courses leading to the Ph.D. degree. They conferred 284 doctorates in course, distributed by fields as follows: biological sciences, including medical and agricultural sciences, 64; engineering and applied science, 19; humanities, 61; physical sciences, 101; and social sciences, 39. Subject matter covered in these courses and other research conducted by university professors and reported in professional journals is encyclopaedic and reflects specialization and variety. Outstanding research in particular fields has become associated with various universities, for example: nuclear research and geophysics in McGill, Queen's, McMaster and Saskatchewan; medical research in such institutions as the Connaught Laboratories and the Montreal Neurological Institute; agricultural research in the western universities; and fisheries research in British Columbia.

Outside financial support for university research comes primarily from four sources: agencies and departments of the Federal Government including the National Research Council and Defence Research Board which provide grants for approved and contracted government-sponsored research; industry which supports both basic and applied research; private foundations which provide grants for approved research, sometimes in selected fields; and provincial governments.

Subsection 5.—Industrial Research

Industrial research in Canada is changing very rapidly. In the past, industry in general was largely unaware of the value of research to its own development and to that of the country, partly because many Canadian companies were subsidiaries of companies in the United Kingdom and the United States and partly because small companies found it impossible to finance their own research. The problem was accentuated by the vast size of the country, the absence of concentration of similar industries and the proximity to the relatively large research facilities of the United States.

However, the emergence of Canada as a highly industrialized society, its entrance into multitudinous fields of production, the rapid growth of many large nation-wide industries, the serving of a discriminating domestic market and the meeting of competition from abroad have had the effect of making Canadian manufacturing establishments research conscious and many of the larger ones now possess competent research organizations. The fields covered by some of these industries are outlined in the 1956 Year Book at pp. 386-389. The research work of the Canadian Pulp and Paper Association, an independent corporation combining efforts of government, university and industry in the expanding field of pulp and paper research, is described in the Forestry Chapter of this volume.

Industrial Research-Development Expenditures.—In 1958 a survey was conducted by the DBS which attempted to measure the extent of the research program undertaken in the preceding year by industrial firms in Canada and to obtain an indication of its direction. A similar survey will be taken in 1960 covering research expenditures in 1959, the results of which will be carried in the 1961 Year Book. In the meantime, summary data from the 1958 survey are repeated here, as being the latest information available on the subject.

Some 2,800 of the larger industrial firms in the country participated in the 1958 survey and the data secured included both direct expenditures and cost of purchasing research-development results from affiliates or other companies or organizations located in Canada and in foreign countries. Data were also obtained on the principal fields in which the research was carried out and on the number of research personnel employed. The magnitude of the research-development costs in 1957 and the increase planned for 1958 give an indication of the size of the program and the direction in which business is searching for new products, for new and more efficient processes and for improvements to existing products and techniques.

The research-development program was reported by industry as totalling \$149,000,000 in 1957 and was estimated at close to \$161,000,000 in 1958. Of the total expenditure in 1957, the major part—amounting to \$125,000,000—was conducted within the companies reporting, an additional \$20,000,000 was spent for research-development done outside Canada, mainly in the United States, and the remaining \$4,000,000 was spent for research done by other companies or organizations in Canada.

1.—Research-Development Expenditures, by Industry, 1957 with Estimates for 1958

Industry	Research Expenditures 1957	Estimated Research Expenditures 1958	Increase or Decrease
	\$	\$	p. c.
Mining, quarrying and oil wells.....	6,279,487	5,260,671	-16.23

¹ Includes tobacco and tobacco products, leather products and miscellaneous manufacturing, construction, health services, engineering and scientific services and trade associations.

² Includes

The following estimates of research-development in the various fields of activity in 1957 show that mechanical, electrical and "other" (mainly aeronautical) engineering, chemistry and metallurgy together accounted for almost 80 p.c. of the total. Expenditures in all engineering fields combined accounted for almost 65 p.c. of the total. Every industry reported some activity in mechanical engineering and at least one other phase of engineering research and also in the chemical research field.

2.—Research-Development Expenditures, by Field of Research, 1957

Field of Research	Amount	Field of Research	Amount
	\$		\$
Chemical engineering.....	10,078,282	Geology, geophysics and other earth sciences.....	1,621,535
Civil engineering.....	935,371	Metallurgy.....	12,879,038
Electrical engineering.....	22,300,993	Medicine.....	2,473,357

Arrangement of industrial-research expenditures by size group based on annual sales of research-active firms shows that the larger firms with annual sales in excess of \$50,000,000 accounted for the major part of the expenditures, although this size group included only 12 p.c. of the firms maintaining research establishments.

3.—Research-Development Expenditures, by Size Group, 1957

¹ Based on annual sales value in 1957.

During 1957 the equivalent of 4,448 professionally trained scientists were employed on research-development projects. The three top industrial groups, in terms of numbers of professionally trained employees, were transportation equipment, electrical apparatus and supplies and chemical products, which together accounted for almost 63 p.c. of the total professional employment in the research field.

Classification of the professional scientists by field and degree of training reveals that for all types of engineers engaged in research there is a greater predominance of professional employees with bachelor degrees. On the other hand, medical scientists, geologists, geophysicists or other earth scientists, chemists, administrators, physicists and agricultural scientists have a greater percentage of the professional employees engaged in research work with doctorate or master degrees than in the engineering field or in the over-all pattern.

In addition the reporting companies employed the equivalent of 7,263 supporting personnel on research-development work, of whom 3,737 were research-development technicians, 802 were skilled craftsmen and 2,724 were other supporting personnel. The average ratio of supporting personnel to professional scientists or engineers for firms conducting research-development was about six to one.

NOTE. —The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Agriculture in Canada, though no longer supreme among the primary industries, is of major importance to the economy of the country as a whole and is still basic to many areas. The area of occupied farmland of 271,756 sq. miles (1956) amounts to only 11.6 p.c. of the total area of the provinces and has shown little increase during the past two decades, but cultivation in this static area has become greatly intensified, producing most of the food products required by a rapidly increasing population and providing surpluses of wheat and other grains, wheat flour, livestock, fruits and vegetables and of many prepared and manufactured agricultural products for world markets. The agricultural economy has been undergoing continual change ever since the pioneer farmer first began to produce more than his requirements and to desire products other than those produced on his own land, but that change has now become extremely marked. The evolution in farming practice under the impact of technological and scientific advances, its commercialization and the development of its greater interdependence on other branches of the economy are outlined in the following special article. Other articles that have appeared in previous Year Books dealing with the historical development of agriculture and with significant features of that progress are listed in Chapter XXVII under the heading "Special Material Published in Former Editions of the Year Book".

THE REVOLUTION IN CANADIAN AGRICULTURE*

Twenty years ago a worker in Canadian agriculture supplied, on the average, enough food for himself and nine other persons. Now he produces enough for himself and twenty-two other persons. This typifies what has commonly become known as the "agricultural revolution". So rapidly is the farming industry changing that in the future it may be possible to look back and find that agriculture was transformed as radically by this revolution as the industrial world was transformed by the industrial revolution of the late eighteenth century.

* Prepared by H. H. Hannam, President and Managing Director, Canadian Federation of Agriculture, Ottawa.

For many decades after Louis Hébert, the first white farmer, began the cultivation of land on what is now the site of the Cathedral of Quebec in Quebec City in the early seventeenth century, farming in Canada developed very slowly. In the early days subsistence farming was practised which means production only for the use of the farmer and his family. As the population gradually increased with the arrival of new settlers, products other than food and clothing were needed by farm families and small industries other than agriculture became established. These non-farmers needed the products of the farms and commercial agriculture involving the sale of agricultural commodities began to replace subsistence farming. Gradually the area devoted to agriculture expanded as land in Eastern Canada was cleared of trees and then more rapidly as settlers moved into the mid-west and began to plough the virgin prairie lands. The decades passed into history and Canada became known to the world as a great agricultural country when wheat from the western plains became the country's first great export staple and other farm products found their way to importing countries in need of them.

The First World War brought intensified demands for food at home and abroad, prices of farm products rose and farm income increased. Farmers called for more labour-saving machinery and equipment, more fertilizers and insecticides and more productive seeds and plants. Canadian agricultural production took a long step forward as new land came under cultivation and farmers increased in number, and the list of countries buying Canadian farm products became longer. However, it was after the start of the Second World War when the North American Continent was faced with the responsibility of providing greatly increased quantities of food and when farm prices began to rise that a virtual revolution started in agriculture in Canada and in the United States. The war ended but the agricultural revolution gained momentum. Resistance to change had been forgotten and the discoveries of farm scientists and engineers were recognized and adopted by increasing numbers of agricultural producers.

The most revealing aspects of this agricultural revolution include the recent decline in the number of farms and in the number of farm workers, the increase in the average size of farms, the changes in the kinds of power used by farmers to produce crops and animal products, the development of specialization and commercialization in agricultural production, the increase in capital invested in farm machinery and equipment, and the larger purchases of fertilizers. The remarkable increase in the production per man hour spent on agricultural enterprises, the increase in yields of crops, in milk per cow and eggs per hen are further evidences of the technical revolution in agriculture.

Farms.—The number of persons living on farms in Canada (according to census figures) increased each decade from 1900 to 1941, though not in proportion to the increase in the population as a whole. However, from 1941 to 1956 the farm population decreased from 3,153,500 or about 27 p.c. of the total population of Canada, to 2,746,800 or 17 p.c. of the total. During those years, the area in farms remained practically unchanged, their number declined from 732,832 to 575,015 but their average size increased from 236.8 acres to 302.5 acres. Almost all the farms in Canada are still family farms, mechanically operated with little hired help.

There are only about 60 p.c. as many workers in agriculture today as there were a decade ago. During the same period the number of farm operators declined about 30 p.c.

Farm Power.—The demands of the war years for greater quantities of food that had to be produced with limited manpower was perhaps the greatest incentive for the utilization of machinery on farms. The farmer's first venture toward mechanization was the purchase of a tractor but that was only the beginning. When a farmer buys a tractor he must also purchase machinery of various kinds if his tractor is to be used efficiently. This new machinery usually includes wider ploughs to turn over more land per day and other larger machinery for preparing the seed beds for farm crops, for weed control and for harvesting. In the years from 1941 to 1956 the number of tractors on farms increased from 152,607 to 388,816 and in the same years the number of horses on farms declined from 2,788,795 to 784,018. On the great western plains it was no longer profitable nor

indeed possible to follow the old method of harvesting and the number of farms using grain combines increased from 18,303 in 1941 to 130,384 in 1956. These larger machines cut down the amount of human labour needed and the time required to do many operations and made it possible to cultivate larger acreages of crops.

Farms with gasoline engines increased by about 20 p.c., and farms with motor trucks increased more than 250 p.c. from 1941 to 1956. At the same time electric power lines were being rapidly extended across the farm lands, particularly in more recent years—in the period 1951 to 1956 the number of farms with electricity increased from 319,383 to 422,604.

Such sources of power have contributed greatly to the reduction in the time required by producers of agricultural commodities to carry on many kinds of work related to their farming enterprises. Only those who have lived on farms can appreciate what the availability of electricity has meant to life on the farm, not only from the production standpoint but in comforts and living conveniences. The farm house now has all the amenities of the city home.

Capitalization and Production per Man.—The trend toward larger farms and the use of labour-saving machines has meant a higher capitalization per farm. Compared with twenty years ago the amount of land under cultivation per farm worker has increased 67 p.c., the livestock population per farm worker has increased 93 p.c. and the volume of power and machinery 213 p.c. Thus, the total of these three forms of capital per farm worker is now almost twice as high as it was twenty years ago. Fertilizers and lime constitute another item of greatly increased expenditure for the farmer. Such outlay was 75 p.c. higher in 1959 than in 1950.

The increase in productivity per man in recent years has been greater in agriculture than in any other Canadian industry, having risen 48 p.c. from 1946 to 1957. In manufacturing the increase was about 40 p.c., in transportation about 34 p.c., in mining about 31 p.c. and in trade only about 7 p.c.

Specialization.—Specialization is becoming more and more a feature of present-day agriculture. Although the farmers on the Canadian prairies have been practising specialization in their wheat economy for a half-century, there has been a growing tendency elsewhere for the individual farmer to give up mixed farming and to specialize in fewer enterprises. This development has in some instances been dictated by climate, soil and distance from markets, but in others it has been prompted by the necessity for reducing unit costs and by the desire to concentrate on scientific production in one field. With the added revenue from large-scale quality production, whether in such specialties as potatoes, poultry, fruits, vegetables, sugar beets or tobacco, the farmer hopes to be able to cover his higher operating costs and capital investment and emerge with a satisfactory net farm income.

There are many examples of the trend toward specialization of agricultural enterprises which have resulted in substantial increases in production. For instance, the number of apple trees on Canadian farms declined from 8,500,000 to 5,400,000 in the years from 1941 to 1956. The days when most farms in the eastern provinces had a few apple trees have passed and apple growing has, to a major extent, become an enterprise in specialized apple-growing areas. Higher yields of apples per tree has been one of the results—in Ontario, for example the production of apples per acre rose from 107.1 bu. in 1951 to 122.8 bu. in 1956.

The number of farms in Canada producing potatoes declined from 1951 to 1956 by nearly 64,000 to about 302,200. However, during the decade from 1948 to 1957, average yields per acre increased in British Columbia from 208 bu. to 275 bu., in Ontario from 133 to 185 bu., in New Brunswick from 237 to 330 bu., and in Prince Edward Island from 225 to 250 bu.

The number of farms in Canada keeping poultry of all ages (except turkeys, geese and ducks) declined from 427,317 in 1951 to 366,869 in 1956, but during that period cash income from poultry meat increased from about \$133,000,000 to \$165,000,000. Eggs

produced per laying hen also increased substantially; in Ontario and Quebec, for example, the increase was about 23 eggs or nearly 15 p.c. Egg production is rapidly becoming a large-scale commercial business. Small farm flocks are being replaced by large commercial production, one plant with mechanical feeding, watering and cleaning equipment raising thousands of layers. The aim in these large-scale operations is low-cost production of a large quantity of high-quality eggs.

In dairying, too, specialization has become prevalent. The pounds of milk produced per cow has risen from 3,935 in 1937 to 4,792 in 1947 and to 5,499 in 1957, and the number of cows per farm has increased considerably. Producers specializing in beef are watching for and accepting the results of new techniques in breeding and in feeding, which includes improved methods of pasture management. Yields per acre of field crops are also increasing as a result of better cultural methods and more productive seeds and plants.

Contract Farming.—Of the many adjustments associated with the technical revolution in agriculture one of the most widely discussed is contract farming, or "vertical integration". There are many examples of this type of development in industry, and though much publicity is now being given to contract farming it is by no means a new development. The growing and marketing of sugar beets, of canning crops, and of certain kinds of seeds under contract has been under way for many years. Fluid milk and beef feeding contracts also go back a long way. What is being hailed as the new development of vertical integration, with varying degrees of approval and alarm, is the invasion of contracting into fields where the growers have traditionally made independent production and marketing decisions, yet where certain kinds of contracts are now removing all management decisions from the control of the producer and making him dependent upon the credit and the market outlets of the trade.

In no industry has vertical integration become so extensively established as in the production of broilers. About 90 p.c. or more of the broiler output in Canada is produced under contracts of one kind or another. These contracts may be agreements between producers and processors for the delivery of broilers at a given time and at a certain price. Another kind of contract may be an arrangement whereby feed dealers advance credit to producers for the purchase of chicks and feed, the farmer making his own marketing arrangements. Contracts may include the type where a feed manufacturer or a processor furnishes chicks and feed to the grower, leases his buildings and equipment, supervises his management and pays him wages for his labour. There are also other arrangements under which the grower shares his profit in return for credit and risk sharing.

Contracts have greatly contributed to the rapid adoption of more efficient practices in the production of poultry meat and have made it available in vastly increased quantities at lower prices to Canadian consumers. In the past ten years since contract farming has been applied to the broiler industry, Canadian production of this commodity has risen to 60,000,000 birds a year. In this specialized industry considerable capital investment is necessary which can be justified only if the operation is on a fairly large scale. In one enterprise there may be as many as 40,000 to 80,000 birds at a time, with four crops produced in one year.

Some features of contract farming have been extended to the production and marketing of other agricultural commodities in recent years, such as hogs, turkeys and eggs.

Canada's Food Needs and Farmer Problems.—The national economy of Canada and its population have made remarkable strides upward in recent years. Gross national production has increased from \$16,300,000,000 in 1949 to about \$34,500,000,000 in 1959 and the population in the same years has risen from 13,500,000 to 17,650,000 persons. The adoption by farmers of new and improved techniques has made it possible for them to provide adequate supplies to satisfy the increased and changing food requirements of the population. With higher purchasing power and a greater appreciation of the need for

more nutritional diet, the Canadian people are eating more per person of the higher priced foods such as fruits and vegetables, meat and eggs and are drinking more milk than they did ten years ago.

While the costs of marketing food between the farmer and the consumer rose 84 p.c. from 1949 to 1958 and food prices rose considerably in that time, non-farm incomes have gone up faster. In fact, these incomes have more than tripled in the past twenty years. Canadians on the average spent only 22.8 p.c. of their 1958 incomes on food compared with 24.4 p.c. in 1949. A week's disposable income in 1958 (for workers in manufacturing industries) would buy 4.1 baskets of food whereas the same week's income in pre-war years (1935-39) would buy only 2.6 baskets of the same foods. Their incomes in 1958 would buy 58 p.c. more food. As a consequence of the increases in the marketing costs of twenty representative foods, Canadian farmers now receive only about 44 cents out of each dollar spent for food by Canadian consumers; in 1951 the farmers' share was 58 cents.

While there have been remarkable advances in the over-all production of agricultural products there are still many farmers with small businesses and low incomes. About 40 p.c. of the farms produce 80 p.c. of the total value of farm production. The problems of the low-income farmers are now receiving much attention by governments and other groups. Part-time farming where the operator obtains most of his income from a non-farm occupation is growing rapidly. More and more families are moving from cities to live in rural areas. Good highways make it possible for the head of the family to drive many miles to town or city employment and in some rural areas there are more non-farm people than farmers.

Besides meeting the domestic food needs of the growing population, Canadian farmers are providing commodities for an increased export trade but, despite these favourable developments in demand, prices of agricultural products have not responded, largely because farm output has been rising faster than the demand at home and abroad.

The technical revolution in agriculture has been the major cause of the production of agricultural commodities beyond the needs of Canadian and foreign buyers. Government price supports have, to a lesser extent, contributed to the development of surpluses of some agricultural products and the existence of surpluses tends to depress market prices of such commodities.

The general trend of agricultural prices has been downward since 1951 while there have been upward trends in non-agricultural prices, in consumer incomes and in business investments. The costs of goods and services required by farmers have increased while agricultural prices have not, which has put the farmers into a situation described as a "cost-price squeeze". As a result of the decline in farmers' net income, Canadian agriculture, in contrast with the buoyant prosperity of many other industries, is in a state of depression. For several reasons it is much more difficult for farmers to move to other lines of work than it is for those in other industries to change their occupations.

The problems of agriculture are not peculiar to Canada. Producers in many countries are experiencing similar troubles. In Canada many programs have been undertaken by the farmers themselves and by farmers in co-operation with governments and international agencies to help solve the existing difficulties of agriculture.

Outlook for Agriculture.—Capital requirements for farming operations will continue to grow in the future with the trend toward larger and fewer commercial farm units. Economies that come from specialized, well-financed and well-managed farms will make it increasingly difficult for the small, poorly managed farms to survive. Management will become a key factor in successful farm operation. Those who cannot develop their farms into economic units will eventually move to industrial occupations and the number of people on farms will continue to decline. The technical advances in agriculture which have been responsible for the production of agricultural products in excess of effective demand will probably delay any rapid improvement in agricultural prices but as population and industrialization in Canada and in food-importing countries continue to advance, as

surpluses disappear and effective demand becomes more pronounced, markets and prices should in time be strengthened. The long-term outlook for Canadian agriculture, therefore, should grow brighter with the passing years.

Section 1.—Federal Government in Relation to Agriculture*

The federal Department of Agriculture dates from Confederation. It was established in 1867 as an outgrowth of a Bureau of Agriculture set up in 1852 by an Act of the Legislature of the Province of Canada. The Department derives its authority from the British North America Act, 1867, which states in part that "in each province, the legislature may make laws in relation to agriculture in the province" and that "the Parliament of Canada may from time to time make laws in relation to agriculture in all or any of the provinces; and any law of the legislature of a province relative to agriculture, shall have effect in and for the province as long and as far as it is not repugnant to any Act of the Parliament of Canada".

A Department of Agriculture with a Minister of Agriculture at its head was accordingly established as part of the Government of Canada. Departments of Agriculture headed by provincial Ministers of Agriculture were also set up by the provincial governments, except in the Province of Newfoundland where agricultural affairs are dealt with by the Agricultural Division of the Department of Mines and Resources. The agricultural affairs of the Yukon and Northwest Territories are administered for the Federal Government by the Territorial Division, Northern Administration Branch, Department of Northern Affairs and National Resources.

Subsection 1.—Services of the Department of Agriculture

Broadly speaking, the activities of the Department of Agriculture may be grouped under three headings: research, promotional and regulatory services, and assistance programs. Research work is aimed at the solution of practical farm problems through the application of fundamental scientific research to all aspects of soil management and crop and animal production. Promotional and regulatory services are directed toward the prevention or eradication of crop and livestock pests, the inspection and grading of agricultural products and the establishment of sound policies for crop and livestock improvement. Assistance programs cover the sphere of soil and water conservation, price stability, provision of credit, and a degree of crop insurance and income security in the event of crop failure. The Department employs a staff of more than 9,000 persons.

Following a reorganization in 1959, the various units were grouped into branches concerned with the broad lines of activity mentioned above. This change superseded an organizational framework that had been in effect since 1937 and was undertaken to bring the Department more closely in line with current needs. Thus the present organization comprises a Research Branch, embracing the activities of the former Experimental Farms and Sciences Services; a Production and Marketing Branch, concerned with regulatory and promotional activities; and an Administrative Branch.

Research Branch.—The Research Branch is the principal research agency of the Department. It conducts a broad program of scientific investigation covering both basic studies and practical attacks on agricultural and forest biology problems. There are seven Research Institutes at Ottawa. Three Research Institutes, nine Regional Research Stations, two Regional Research Laboratories, 27 Experimental Farms, 21 Laboratories, two Forest Nursery Stations, and 20 Substations are located throughout the ten provinces and the Yukon and Northwest Territories.

The Research Branch serves all principal agricultural and forest areas in Canada and co-ordinates its efforts with those of the National Research Council, universities and kindred agencies. One staff group is charged with the planning and co-ordination of the program and another with the administration required to carry it out. Five directors

* Prepared under the direction of S. C. Barry, Deputy Minister of Agriculture, Ottawa.

representing divisions of animals, crops, soils, entomology and plant pathology, and forest biology assist the programming of the work. Three research services—Statistics, Engineering, and Analytical Chemistry, located with the Administrative and Executive group at Ottawa—provide research groups across the country with specialized leadership and service and undertake critical researches or other creative work as required.

The Institutes.—The Institutes are organized on a scientific rather than a problem basis and are engaged primarily on basic research of wide application to agriculture and forest biology. They also carry out related national work such as the identification of plants, insects and pathogens. There are seven Institutes at Ottawa and one each at London, Belleville and Sault Ste. Marie, all in Ontario.

The Animal Research Institute covers the fields of genetics and breeding, nutrition, physiology, biochemistry, and management, and tackles problems in the production of milk, beef, lamb, pork, poultry, eggs and fur.

Plant studies are carried out at the Plant Research and the Genetics and Plant Breeding Research Institutes in taxonomy, physiology, biochemistry, pathology, agrometeorology, weeds, and fruit and vegetable processing and storage. Cytological and genetic studies on cereal, forage, tobacco and horticultural plants are made by the Genetics and Plant Breeding Research Institute with special reference to problems encountered in the breeding programs and the assessment of quality characteristics.

The staff of the Soils Research Institute is engaged in studying genesis and classification, fertility, mineralogy and the organic, physiochemical and physical aspects of soils. This Institute gives leadership to the federal-provincial soil survey program through classification studies and by developing and standardizing analytical methods. It also provides a national soil mapping service.

A major section of the Entomological Research Institute deals with taxonomy, other assignments being in the fields of genetics, physiology, nematology and apiculture. The Institute assembles and maintains the national collection of insects.

The Microbiological Research Institute is mainly concerned with metabolism, nutrition and genetics of bacteria of agricultural significance.

The Dairy Technology Research Institute investigates problems in sanitary milk production and the processing of dairy products and undertakes projects to improve existing dairy products and to develop new ones.

The Pesticide Research Institute at London, Ont., examines chemicals used or intended to be used for insect, disease or weed control and investigates the reason for and the nature of the biological activity of the chemical.

The Biological Control Research Institute at Belleville, Ont., is concerned with efforts to control destructive insect pests and noxious weeds with parasitic and predaceous insects, and with insect disease organisms. It is also the principal importing centre for beneficial insects and for some disease organisms from foreign countries.

The Insect Pathology Research Institute at Sault Ste. Marie, Ont., is the major importing centre for disease organisms. Insect diseases, including viruses, fungi, bacteria and protozoa are studied.

The Regional Institutes, Stations and Services cope with primary problems in various regions in all provinces. Nine major laboratories are working on forest and shade trees, and on forest products diseases and pests in conjunction with provincial forest services and the forest industries.

Other units have undertaken projects assisting in the exploitation of peat bogs, reclamation of marsh land for pasture, propagation of shelterbelt trees and prevention of soil erosion, dryland agriculture, the growing of special crops such as tobacco, and livestock breeding.

The Research Laboratory at Winnipeg, Man., has a world-wide reputation for its contribution in the field of cereal rusts and is the national centre for investigations concerning insects in stored products.

Production and Marketing Branch.—The Production and Marketing Branch represents a consolidation of the former Production Service and Marketing Service and also includes the Agricultural Stabilization Board and the Agricultural Products Board. The regulatory functions of the Department of Agriculture are thus centred in one branch.

The Health of Animals Division administers the Animal Contagious Diseases and the Meat Inspection Acts, and also operates Animal Pathology laboratories. Besides its responsibility in carrying out various disease prevention measures, the Division operates programs for the eradication of bovine tuberculosis and brucellosis and gives health certificates for livestock entering export trade. The Animal Pathology laboratories, in addition to their research function, manufacture diagnostic reagents and biological products and provide analytical and diagnostic services for domestic and wildlife diseases. District laboratories across the country give routine diagnosis and research services.

The Livestock Division administers the Livestock Pedigree Act, Record of Performance for dairy cattle, beef cattle and swine, supervision of race track betting, the grading of meat, wool and fur and the compiling and interpreting of market information.

The Poultry Division carries out the policies of the National Poultry Breeding Program, including Record of Performance for poultry and hatchery inspection, and administers the regulations for the grading of poultry products.

The Fruit and Vegetable Division administers legislation having to do with the grading of fruit and vegetables in both fresh and processed form, maple products, and honey.

The Dairy Products Division is responsible for the administration of legislation covering grades and standards of dairy products, including butter, cheese, concentrated milk products and ice cream.

The Plant Products Division administers Acts and regulations respecting seeds, feed-stuffs, fertilizers and pest control products, conducts field inspection and maintains regional testing laboratories.

The Plant Protection Division is responsible under the Destructive Insect and Pests Act for safeguarding against the introduction of serious plant insects or diseases into Canada or their spread in Canada, for certifying freedom from disease and pests in plant exports, and for seed potato certification.

The Consumer Section helps to promote proper use of Canadian agricultural food products through experimental work, carried on by its home economists, on cooking foods and preserving perishables.

The Transportation, Storage, and Retail Inspection Section administers the Cold Storage Act dealing with the payment of subsidies for the construction of public cold storage; cargo inspectors at the main Canadian ports check the handling of goods moving to export, and inspectors make spot checks on retail outlets to see that food products meet the prescribed standards for quality and grade.

Agricultural Stabilization Board.—The functions and operations of this Board, established in 1958 under the Agricultural Stabilization Act for the purpose of supporting the prices of agricultural products, are described in the Domestic Trade Chapter of this volume in a special article which deals with "Controls over Pricing and Marketing of Farm Products other than Grain".

Agricultural Products Board.—The Agricultural Products Board, first established in 1951 under the Emergency Powers Act, was reappointed under the Agricultural Products Board Act dated Jan. 23, 1952. The Board was established as an auxiliary or facilitating body for the purpose of purchasing, selling or delivering agricultural products pursuant to any agreement or contract made by the Government of Canada as may seem appropriate, as agent for the Agricultural Stabilization Board.

Administration Branch.—Besides its general responsibility for the business management of the Department, the Administration Branch embraces the division concerned with Information and Economics. For the present, rehabilitation and assistance programs are also associated with this Branch.

The Economics Division collects, analyses and interprets economic information required to form and administer departmental policies and programs. It conducts economic surveys and research designed to improve agricultural production, marketing, and farm living conditions. The Division acts as an economic and statistical research agency for the Agricultural Stabilization Board, the Prairie Farm Rehabilitation Administration and other bodies, assisting in any economic undertaking with which the Department is concerned.

The Information Division gathers and publishes information arising from research work and the development and regulatory programs of the Department. It employs all the recognized media—printed publications, press and radio releases, motion pictures and television. In addition, the Division operates the central library of the Department and a system of field libraries located at major research centres of the Department across Canada.

Subsection 2.—Farm Credit and Assistance

The Federal Government has made provision for the extension of credit to farmers under the Farm Credit Act (replacing the Canadian Farm Loan Act) and under the Farm Improvement Loans Act. Cash advances are made to grain producers under the terms of the Prairie Grain Advance Payments Act. Certain financial assistance in event of crop failure is provided by the Prairie Farm Assistance Act. Also, following the drought in Western Canada in 1957, which resulted in a reduced crop, arrangements were made under the Western Grain Producers Acreage Payment Regulations (Order in Council PC 1958/1442) for paying to each grain producer a sum of \$1 for each acre seeded in 1958, up to the amount of \$200. Total payments under these regulations amounted to approximately \$40,000,000. These measures, with the exception of the one-time acreage payment regulations, are discussed in detail in the following paragraphs.

The Canadian Farm Loan Act and the Farm Credit Act.—Long-term farm mortgage credit is available to Canadian farmers for the purchase of land, livestock and farm equipment, to make farm improvements and to pay debts, under the provisions of the Farm Credit Act enacted by Parliament on July 18, 1959 and proclaimed in force on Oct. 5, 1959. This Act repealed the Canadian Farm Loan Act and established the Farm Credit Corporation as an agent of the Crown in right of Canada to administer a system of long-term mortgage credit as the successor to the Canadian Farm Loan Board established in 1929 under the Canadian Farm Loan Act.

At the time of repeal of the Canadian Farm Loan Act, the maximum loan for all legitimate farm purposes was limited to 65 p.c. of the appraised value of the farm taken as security, not exceeding \$15,000, repayable within 30 years. The new Act gives the Farm Credit Corporation substantially broader lending powers. Under Part II of the new Act, the Farm Credit Corporation may lend up to 75 p.c. of the appraised value of the farm taken as security, not exceeding \$20,000, repayable within 30 years. In addition to loans under Part II, the Corporation is empowered to make loans to young farmers, aged 21 to 44 inclusive, having five years experience in farming, to enable them to become established on economic farm units. These loans are based on first mortgage security of farm land and additionally, where required, on the security of livestock and farm equipment. The maximum Part III loan may not exceed 75 p.c. of the value of the land and chattels, nor \$27,500. That portion of the loan based on chattel security is repayable within 10 years and the remainder of the loan within 30 years. A loan under Part III is additionally secured by insurance on the life of the borrower and his farming operations are subject to supervision by the Corporation until the loan is reduced to 65 p.c. of the value of the farm land. The interest rate on all loans is fixed at 5 p.c. by the Act.

Funds for lending are borrowed at current interest rates from the Minister of Finance. The aggregate amount of loans from the Minister at any time outstanding may not exceed 25 times the capital of the Corporation. On establishment, the Corporation succeeded to \$5,000,000 capital of the Canadian Farm Loan Board and the Act fixes the authorized capital at \$8,000,000.

In the fiscal year ended Mar. 31, 1959, the Canadian Farm Loan Board approved 4,805 loans for a total of \$30,144,950 as compared with 3,702 loans for a total of \$21,278,450 in the preceding year. At Mar. 31, 1959, the total amount outstanding in loans was \$91,298,119, as compared with \$68,490,523 for the previous year. This amount was secured by 25,471 first mortgages and 891 second mortgages.

The Farm Improvement Loans Act.—The Farm Improvement Loans Act, administered by the Department of Finance, is designed to provide credit by way of loans made by the chartered banks to assist in almost every conceivable purchase or project for the improvement or development of a farm and includes the purchase of agricultural implements, the purchase of livestock, the purchase and installation of agricultural equipment

or a farm electric system, the erection or construction of fencing or works for drainage on a farm, and the construction, repair or alteration of farm buildings including the family dwelling. Credit is provided on security related to the purchase or project and on terms suited to the individual borrower.

The legislation, originally operative for three years (1945-48), has been continuous by way of extensions usually for three-year periods. In 1959 the Act was extended for a further period commencing Apr. 1, 1959 and ending June 30, 1962. By the latter extension, full-time beekeepers were made eligible for loans and the maximum loan or amount available at any one time to a borrower was increased from \$5,000 to \$7,500. The maximum term of a loan and interest rate remain at ten years and 5 p.c. simple interest, respectively. The borrower is required to provide from 10 p.c. to 40 p.c. of the cost of his purchase or project, depending on the loan category to which it belongs. The Federal Government guarantees each bank against loss sustained by it up to an amount equal to 10 p.c. of loans granted by it in a lending period. This guarantee does not apply to any loan made after the aggregate of all loans made by all banks in a given period reaches an amount fixed by statute. The current maximum stands at \$300,000,000. By Dec. 31, 1958, 1,282 claims amounting to \$835,772 had been paid under the guarantee since the inception of the Act, representing a net loss ratio of less than one-tenth of one percent after recoveries have been taken into account.

By the end of 1958, \$674,433,667, or 82.9 p.c. of the total loans made had been repaid. The position at that time was as follows:—

<i>Period</i>	<i>Loans Outstanding</i>	<i>P.C. of Total Loans Outstanding</i>
1945-48.....	4,965	0.02
1948-51.....	296,342	0.2

Prairie Grain Advance Payments Act.—This Act, which came into force on Nov. 25, 1957, provides for an advance payment to producers for threshed grain (wheat, oats and barley) in storage other than in an elevator and prior to delivery to the Canadian Wheat Board, exclusive of grain deliverable under a unit quota. Advance payments of 50 cents per bu. of wheat, 25 cents per bu. of oats and 35 cents per bu. of barley are made, subject to certain restrictions as to quota and acreage. Maximum advance payment per application is \$3,000.

At Dec. 31, 1959, the following advance payments had been made:—

Period	Applications	Total Advance	Average Advance
	No.	\$	\$
Aug. 1, 1957—July 31, 1958.....	50,412	35,203,467	698
Aug. 1, 1958—July 31, 1959.....	45,341	34,369,653	758
Aug. 1, 1959—Dec. 31, 1959.....	43,004	33,789,473	785

Repayment is effected by deducting 50 p.c. of the initial payment for all grain delivered subsequent to the loan, other than for grain delivered under a unit quota. The amounts deducted are paid to the Board until the producer has discharged his advance.

At Dec. 31, 1959, refunds had been made as follows:—

Period	Total Refunded	Total Advance Outstanding	Percentage Refunded
	\$	\$	
Aug. 1, 1957—July 31, 1958.....	35,172,468	30,999	99.9
Aug. 1, 1958—July 31, 1959.....	34,057,795	311,858	99.0
Aug. 1, 1959—Dec. 31, 1959.....	10,057,271	23,732,202	29.7

Prairie Farm Assistance Act.—The Prairie Farm Assistance Act, passed in 1939, provides for direct money payments by the Federal Government on an acreage and yield basis to farmers in areas of low crop yield in the Prairie Provinces and in the Peace River area of British Columbia. The purpose of the Act is to assist in dealing with a relief problem which the provinces and municipalities could not do alone and to enable the farmers to put in a crop the following year.

Payments for the 1958 crop year at July 31, 1959, totalled \$23,103,462, divided by provinces as follows: Manitoba, \$1,167,341 in 6,022 awards; Saskatchewan, \$14,999,630 in 48,032 awards; Alberta, \$6,801,756 in 27,789 awards; British Columbia, \$134,735 in 654 awards.

All farmers contribute to the program to the extent of 1 p.c. of sales of wheat, oats, barley, rye, flax and rapeseed. The levy for the crop year 1958-59 amounted to \$6,674,000. Since 1939, levies have raised \$113,985,190 and \$227,543,546 has been paid out in 1,036,967 awards. The additional funds required for payments are provided from the federal treasury without interest.

Subsection 3.—Canada's Relationship with FAO

The Food and Agriculture Organization of the United Nations, currently consisting of 77 member governments, was created for the purpose of promoting national and international action to improve the efficiency of the production, processing, distribution and utilization of all food and agricultural products, with the aim of assisting all countries to raise the levels of nutrition and standards of living of their people. It collects and disseminates information to help its member governments and others who wish it to improve their methods of cultivation, fishing, forestry, marketing, agricultural credit and so on. It is called upon to contribute in many ways to the development and co-ordination of national agricultural programs and policies.

The Conference of the FAO meets every two years and its Council, made up of 25 member nations, meets about twice a year or whenever necessary. The Conference reviews the world situation in food, agriculture, fisheries and forestry as well as the operation of the FAO Secretariat. The Council, meeting more frequently, keeps an eye on price trends and supplies.

The actual day-to-day work of the Organization is carried out by about 1,500 staff members assigned to Headquarters and the five Regional Offices. Over 50 nationalities are represented on the staff. The Organization has been reorganized during the past two years and is divided into two departments consisting of 10 technical divisions covering the following: Land and Water Development; Plant Production and Protection; Animal Production and Health; Rural Institutions and Services; Forestry and Forest Products; Fisheries; Statistics; Economic Analysis; Commodities; and Nutrition; and one service department which deals with matters related to administration of meetings and protocol and includes divisions covering information, publications, preparation of reports on rural legislation and a library.

There are also over 50 committees consisting of technicians representing member nations who are interested in specific problems. These include: the Committee on Commodity Problems; the International Rice Commission; the FAO Desert Locust Control Committee; the Fisheries Council; FAO Liaison Committee on Fishery Products Technology; European Commission for the Control of Foot-and-Mouth Disease; the Regional Forestry Commissions; etc.

FAO also administers a Technical Assistance Program with about 435 technical assistance experts assigned to field projects in nearly 65 countries or political subdivisions. New activities have come out of the recently established United Nations Special Fund. By the end of 1959, FAO had been asked to administer five major capital projects, four of them related to water management. FAO's current operating resources are \$9,225,500 per year. In addition, an amount almost equal to the regular budgetary total is allocated to FAO by the United Nations Technical Assistance Administration and the Special Fund.

Technical Activities.—FAO acts as an instrument of collaboration in the effort to control pests and disease. Throughout the Middle East, international control and prevention measures, co-ordinated by FAO, are aimed at controlling locusts. The European Commission for the Control of Foot-and-Mouth Disease, created in 1952 under FAO auspices, is working toward the complete eradication of the disease. Another field for

greater international action is in the development of river basins and watersheds affecting several countries. Along with other UN agencies, FAO is studying the land and water development potentialities of the Mekong Valley at the request of the Governments of Viet-nam, Cambodia, Laos, and Thailand. Studies are being made in respect of fishing boats and fish harbours. The items mentioned are only a few illustrations of the scope of the technical activities of the FAO.

Commodity Review.—The work of the FAO Conference, the Council and the Committee on Commodity Problems in the commodity field may be summarized as follows: (1) making a periodic review of the commodity situation; (2) providing a forum for discussing problems, exchanging views and studying national policies; (3) sponsoring specialized commodity study groups; (4) reviewing proposals for action and making recommendations; (5) publishing reports on commodity policies and developments; (6) co-operating with other international commodity agencies in the preparation and review of commodity situation reports and in the consideration of proposals for action programs.

A major activity is the study of the problem of commodity surpluses by the Sub-Committee on Surplus Disposal located in Washington, which is concerned with ways and means of using surpluses to establish national food reserves and/or to finance economic development in under-developed countries. Special aspects of the surplus problem are also the concern of other FAO commodity groups, such as the Group on Grains which has undertaken study of the causes of the present imbalance in the wheat and coarse grains situation, and the commodity groups concerned with rice, copra, cocoa, dairy products and citrus fruits.

Canada and the FAO.—Canada's interest in the FAO began with the Hot Springs Conference. The United Nations Interim Commission on Food and Agriculture was established by this Conference and was headed by a Canadian. It laid the groundwork for the first FAO Conference which was held at Quebec City in 1945. In the same year the Canadian Parliament passed the Food and Agriculture Organization of the United Nations Act which provided for the carrying into effect of the "Agreement for a Food and Agriculture Organization of the United Nations between Canada and certain other Nations and Authorities". This Act approves the Constitution of the Food and Agriculture Organization and empowers the Governor in Council to make such appointments, establish such offices, make such Orders in Council, and do such things as appear necessary for carrying out the provisions of the Constitution.

Canada is a member of the Council, the Committee on Commodity Problems (CCP), the Consultative Sub-Committee on Surplus Disposal, and the FAO Group on Grains, the Committee on Constitutional and Legal Matters, and is participating in a number of working parties sponsored by the FAO dealing with a variety of problems.

Over 100 Canadians have been on FAO technical assignments since 1951. For some of these experts there were repeat performances. Others have been invited to participate on panels of experts dealing with nutrition, plant protection, forestry, fisheries and atomic energy. A number of Canadians are on the staff at Headquarters in Rome.

Early in 1946, member nations were invited to establish the National FAO Committees to maintain liaison between FAO Headquarters and their respective governments. In accordance with this request a Canadian Interdepartmental FAO Committee was formed to provide a link between the FAO and the Canadian Government on questions pertaining to FAO. The Committee is composed of senior government officials representing the Departments of Agriculture, Fisheries, Northern Affairs and National Resources (Forestry), National Health and Welfare (Nutrition), Trade and Commerce, External Affairs, Finance, and the Dominion Bureau of Statistics.

Section 2.—Provincial Governments in Relation to Agriculture*

Subsection 1.—Agricultural Services

Newfoundland.—Government agricultural services in Newfoundland are operated by the Agricultural Division of the Department of Mines and Resources. The Division is in charge of a Director who is assisted by a staff of 21 officers. For purposes of administration, the province is divided into nine districts. A fieldman with permanent headquarters is located in each district except Labrador, where the officer is resident for the summer only. Officers in charge of different phases of agricultural development visit each district on assignments from the St. John's office.

Departmental policies in support of the agricultural industry include: a bonus of \$125 an acre on land cleared by privately owned equipment; the distribution of ground limestone at a subsidized rate; the payment of bonuses on purebred sires; and financial assistance to agricultural societies, marketing organizations and exhibition committees. An inspection service is provided for poultry products, vegetables and blueberries, production of the latter being encouraged by the burning of suitable berry areas and the improvement of roads and trails leading to them. Small fruit development is promoted through the distribution of quality foundation stock.

Every encouragement is given to the production of livestock. An experimental sheep flock is maintained. Poultry and beef production have increased with favourable marketing conditions and with departmental assistance and loans under the Provincial Farm Development Loan Act. A veterinary supervises the health of animals program and the joint federal-provincial project for the eradication of bovine tuberculosis.

The Agricultural Division co-operates with the Department of Education in furthering the 4-H Club movement in the province and accepts responsibility for all projects pertaining to agriculture.

Prince Edward Island.—The activities of the provincial Department of Agriculture are suggested by its staff which includes, in addition to the Minister and Deputy Minister, a Dairy Superintendent and Assistant, two Check Testers, two Dairy Herd Improvement Promoters, a Director of Veterinary Services and eight subsidized practising Veterinarians, a Horticulturist, a Soil Analysis Assistant, a Poultry Fieldman, an Economist, two Agronomists, a Director of 4-H Clubs, a Nursery Supervisor, and a Director, an Assistant Director and two Extension Workers of Women's Institutes.

Nova Scotia.—The Department of Agriculture and Marketing endeavours to "help the people to help themselves" through strengthening member interest in such organizations as the Nova Scotia Federation of Agriculture, Nova Scotia Fruit Growers' Association, various agricultural co-operative organizations, credit unions and producer organizations. The Department is assisted by the Nova Scotia Advisory Committee on Agricultural Services which has been established to promote agricultural policies and projects of the federal and the provincial Departments of Agriculture. The Committee meets quarterly to determine how the work of these Departments may be co-ordinated and directed through integrated agricultural policies and with a minimum duplication of services.

New Brunswick.—Provincial government agricultural policy in New Brunswick is directed by the Department of Agriculture. The Department is headed by the Minister of Agriculture who is assisted by a Deputy Minister and the Directors of the following services: extension, livestock, dairy, veterinary, poultry, horticulture, field husbandry, plant protection and promotion, agricultural engineering, home economics, Credit Union Co-operative Association, agricultural education and agricultural societies.

Quebec.—The Department of Agriculture of Quebec comprises 11 services: rural education, rural economy, extension, animal husbandry, horticulture, field husbandry, information and research, home economics, animal health, rural engineering, and the secretariat. Each service is divided into sections dealing with particular problems.

* Information supplied by the agricultural authorities of the various provinces.

The Department also includes many other special organizations such as the Research Council, the Dairy Industry Commission, the Dairy School of St. Hyacinthe, the Provincial Extension Farm (Deschambault), the Fur Bearing Animals Extension Farm (St. Louis de Courville). The Farm Credit Bureau, the Quebec Sugar Refinery (St. Hilaire), the Provincial Veterinary School (St. Hyacinthe) and the Office of Rural Electrification are also under the authority of the Minister of Agriculture.

The annual competition for the Agricultural Merit Order, organized in 1890, is held successively in each of five regions. Each contest lasts five years and covers various farm products; its objective is to ascertain the personal merit of the competitors who have most distinguished themselves in the agricultural field and can serve as examples. County Farm Improvement Contests have for 30 years promoted better methods of culture designed to increase farm income and 7,530 competitors have benefited from them.

The Drainage Service deals with soil improvement or land reclamation by renting equipment at very low rates to farmers who wish to improve their crop lands. The Department of Agriculture also gives assistance to such projects in the form of grants. Soil improvement measures include large drainage projects carried out by the Department and smaller projects carried out by groups of farmers with government help. In 1958, 44,209 farmers benefited from help given by this service.

Various forms of assistance are offered towards improvement of crops and livestock. An artificial insemination station operates at St. Hyacinthe for the benefit of breeders' clubs, and plant breeding stations for cereal and forage crops, vegetables and small fruits are maintained in a number of localities. Trained specialists are employed in the work of controlling plant and animal pests and diseases; the main laboratories are situated at Quebec City and field laboratories are located in other districts.

Agricultural co-operation is widespread in Quebec. There are 508 co-operatives with 69,829 members and 89 agricultural societies with 28,452 members to serve local interests and organize county exhibitions. There are also 713 Cercles de Fermières (Women's Institutes) in operation with a membership of 36,903; 425 farmers' clubs with a membership of 20,182; and 316 junior farmer clubs in which 8,607 young boys and girls are working on numerous practical agricultural projects.

The Farm Credit Bureau was established in 1936. By December 1958 the Bureau had made 56,660 loans to farmers amounting to a total of \$165,427,000; 26,531 of these loans were for the establishment of young men on farms.

An Agricultural Research Council was established by the Department in 1957. It is a consultative body composed of professors from the senior agricultural colleges of the province. It has no laboratories but encourages research in all fields of agriculture by means of subsidies to the faculties of agriculture of the provincial universities to be carried out under the supervision of the university staffs. The Council also has a scholarship plan to encourage the education of young agronomists. The findings of research projects undertaken under the auspices of the Department of Agriculture are published by the Council in *Recherches agronomiques*.

Ontario.—The Ontario Department of Agriculture provides financial assistance and administrative services through its Head Office, nine Branches, two Experimental Farms, and through research and extension work carried out at the Ontario Agricultural College, the Ontario Veterinary College, Macdonald Institute, Western Ontario Agricultural School, the Kemptville Agricultural School and the Horticultural Experiment Station.

The Department is divided into two main Divisions—the Division of Production and the Division of Marketing. Each is under the direction of an Assistant Deputy Minister, directly responsible to the Deputy Minister. The Division of Production is composed of the Live Stock Branch, Extension Branch, Agricultural and Horticultural Societies Branch, Field Crops Branch, Farm Economics and Statistics Branch, and the

Milk Production Program. The Division of Marketing administers the affairs of the Markets Branch, Dairy Branch, Co-operative Loans Board, Milk Industry Board, Farm Products Marketing Board, Ontario Stock Yards Board, Ontario Food Terminal Board, and the Farm Products Inspection Service.

The Live Stock Branch promotes livestock improvement policies with particular attention to the health of animals, gives support to purebred livestock associations, licenses artificial insemination centres, community sales, wool warehousemen and egg grading stations.

Through a staff of Agricultural Representatives, one of whom is located in each county and district, the Extension Branch carries on an educational and extension service, gives leadership to 4-H Club work and to the Ontario Junior Farmers' Association. This Branch also administers policies providing assistance to farmers and settlers in northern Ontario in connection with land clearing and breaking and improvement of farms and livestock. The Home Economics Service, which is part of the Extension Branch, gives leadership to organized activities of rural women.

The Agricultural and Horticultural Societies Branch provides assistance to agricultural and horticultural fairs and exhibitions, ploughing matches and other competitions and administers the Community Centres Act.

The Field Crops Branch assists in the development of good cultural practices and promotes the use of improved strains of seed and works for the improvement of pastures. It also administers the Weed Control Act.

The Farm Economics and Statistics Branch carries on research in farm business including cost analysis, marketing, and land use. In co-operation with the Dominion Bureau of Statistics it gathers and publishes statistics of agricultural production.

The Markets Branch administers the Farm Products Marketing Act; the Farm Products Grades and Sales Act; the Co-operative Loans Act; the Grain Elevator Storage Act; and the Farm Products Containers Act.

The Dairy Branch provides an inspection, instruction and supervision service to all dairy factories and promotes the production of clean milk on farms. The Milk Industry Board of Ontario, functioning under the authority of the Milk Industry Act, regulates and supervises the marketing of milk and cream.

The Information Branch prepares and distributes—through press, radio, television and publications—information of value to producers and consumers of Ontario's farm products.

The Ontario Agricultural College, including Macdonald Institute and the Ontario Veterinary College, all located at Guelph, provides research and extension services to Ontario agriculture, as does the Horticultural Experiment Station at Vineland, the Western Ontario Agricultural School and Experimental Farm at Ridgeway, and the Kemptville Agricultural School at Kemptville. Demonstration Farms in northern Ontario, one at New Liskeard and another at Sault Ste. Marie, are operated for the demonstration of methods adaptable to the area concerned, present emphasis being on beef cattle production. Supervision of the schools and colleges, experimental farms, and the Ontario Telephone Authority, is the direct responsibility of the Deputy Minister of the Department.

Manitoba.—The Department of Agriculture serves Manitoba through the following branches: agricultural extension; livestock; dairy; soils, crops and weeds administration; agricultural publications, statistics and radio and information service; co-operative services; and the provincial veterinary laboratory.

The Extension Service deals with agricultural economics, horticulture, poultry, agricultural engineering, beekeeping, 4-H Clubs and women's work, and has specialists devoting attention to these subjects. Meetings, field days and short courses are held. Thirty-five agricultural representatives are located throughout the province, each serving from one to five municipalities; 12 home economists serve designated areas.

The Live Stock Branch administers the Animal Husbandry Act, develops and administers policies that encourage the improvement and production of livestock, and works in close co-operation with the Veterinary Laboratory Service and the federal Health of Animals Division in the control of livestock diseases.

The Dairy Branch administers the Dairy Act, supervises the grading of cream, inspects creameries and cheese factories, gives instruction in cheese and butter making, issues licences to makers of dairy products and to cream graders and conducts a dairy-cost study among milk producers. Extension activities include addressing meetings and preparing articles and leaflets on dairy farm problems.

The Soils and Crops Branch deals with grain and forage crops, conservation and fertility and provides liaison between the Government of Manitoba and the Government of Canada in regard to PFRA projects. The Branch develops and administers policies that encourage good field crop husbandry and conservation practices. The Weeds Section directs the activities of 18 municipal weed control units comprising 70 rural municipalities engaged in eradicating deep-rooted, persistent, perennial weeds; supervising weed demonstrations; investigating weed problems; conducting weed surveys; and preparing weed literature, mounted weed specimens, etc.

The Agricultural Publications and Statistics Branch publishes and distributes annually approximately 100,000 bulletins, circulars, posters, leaflets, etc. It provides the public with agricultural statistics relating to Manitoba agriculture, and maintains an information service which uses the media of the press, radio and TV.

The Co-operative Services Branch takes care of the registration and supervision of co-operatives and credit unions and the administration of the Acts governing them. The Branch also collects and compiles statistics on co-operative activity throughout the province.

The Veterinary Laboratory operates a diagnostic laboratory for animal diseases, the services of which are available to veterinarians and livestock owners.

Saskatchewan.—The Saskatchewan Department of Agriculture is organized in the following branches and services.

The Administration Branch handles general staff records and accounts. Data on crop conditions, production, marketings and income are collected and farm information dispensed daily over seven private radio stations.

The Agricultural Representative Service has a field staff of 38 agricultural representatives, four area supervisors and specialists in farm management, farm mechanics, and visual aids. This extension field staff serves all Branches of the Department as well as the other agencies operating within the Co-operative Agricultural Extension Program. Agricultural representatives are active in all federal, provincial and university farm services. In farm labour matters, co-operation is maintained with the federal Department of Labour and the National Employment Service in directing annual movements of farm labour in and out of the province. Agricultural representatives work through Agricultural Conservation and Improvement Committees in each rural municipality and local improvement district to supply the farmer with scientific and practical information. Committees study local farm problems and initiate improvement programs. Through an Earned Assistance Program the Department pays one-half the cost of local group development projects.

The Animal Industry Branch has four divisions. The Dairy Division administers dairy herd improvement programs and assists producers with management and production problems; inspects and licenses dairy manufacturing and frozen-food locker plants; and administers dairy, locker plant and margarine legislation. The Livestock Division encourages the use of suitable animals for breeding purposes by the establishment of purebred sire areas and by assistance in the purchase and distribution of stallions, bulls, boars and rams. It registers brands, licenses livestock dealers and agents and promotes programs on insect control, feeding and management. The Poultry Division maintains flock testing and turkey grading services; administers an approved hatchery policy; licenses produce

dealers and poultry buyers, hatcheries and hatchery agents. It also assists with poultry shows and field days and otherwise promotes flock improvement. The Veterinary Division assists students in veterinary science under a scholarship plan, administers disease testing and vaccination programs and co-operates with Federal Government officials and local veterinarians in disease prevention and control.

The Conservation and Development Branch provides engineering services for irrigation development, usually in co-operation with the Federal Government, and for drainage programs and projects. Reclamation of land by drainage, development of misused land and under-utilized land, and construction of provincial community pastures all come within its jurisdiction. The Branch provides engineering assistance to conservation and development areas, water users' districts, and irrigation districts in connection with water control projects.

The Lands Branch administers all Crown, school, and Land Utilization Board lands except forest reserves and parks in the settled area of the province; classifies it according to the use for which it is best suited; disposes of such lands under long-term leases; secures land control for land utilization projects; supervises new settlement projects; pays for clearing and breaking by farmers on provincial leases; and operates provincial community pastures.

The Plant Industry Branch organizes and administers programs for crop improvement and crop protection, and advises on seed and crop improvement, soil conservation, horticultural problems, weed control and management of irrigated land. The improvement of grassland is promoted through a forage crop program. The Seed Plant Division carries on custom cleaning of forage seeds and registered cereals. The Apiary Division advises on beekeeping and honey production, supervises and carries on continuous inspection.

The Agricultural Machinery Administration, established in 1958, carries out a testing service on farm machinery as well as an inspection service, and licenses dealers in farm machinery.

Alberta.—The Alberta Department of Agriculture is organized in the following branches and services.

The Field Crops Branch administers programs and policies relating to crop improvement, soil conservation and weed control, crop protection and pest control, horticulture and apiculture. Agricultural Service Boards have been organized in municipal districts to assist with agricultural programs, and the Department of Agriculture is represented on each Board.

The Live Stock Branch aids in maintaining the quality of herds and flocks by assisting farmers in securing purebred herd sires and assists artificial breeding associations in the breeding of dairy cattle. The Branch also supervises livestock feeder associations and administers legislation relating to stock inspection, brands, domestic animals and the sale of horned cattle.

The Dairy Branch administers the Dairymen's Act and the Frozen Food Locker Act. Grading and purchasing of raw produce by all dairy plants are under regulation, as are standards of construction, manufacture, processing, sanitation, and temperature control for dairies and frozen food lockers. A regular cow-testing service is available to dairy producers and the Branch laboratory conducts chemical and bacteriological analyses needed for industrial directives. Yearly cost studies and dairy farm management services are in operation in the principal milk-producing areas.

The Poultry Branch carries on programs for the improvement of poultry husbandry and supervises flock approval for the control of pullorum disease. The Branch issues hatchery, wholesale, first receiver and truck licences for the handling of poultry products.

The Veterinary Services Branch provides scientific diagnoses of livestock and poultry diseases through its laboratory; conducts investigations of disease conditions; lectures in veterinary science at the University of Alberta, Schools of Agriculture, and many meetings; and promotes government policies aimed at reducing losses throughout the province.

The Agricultural Extension Service operates 43 offices and employs the services of 56 district agriculturists and 21 district home economists. The district agriculturists assist farmers with their problems and advance departmental policies designed to improve the standard of agricultural practices. The district home economists provide a similar service for farm women. Bulletins are prepared dealing with agricultural and home economics topics. The Branch is responsible for the supervision of agricultural societies and, in co-operation with the federal Department of Labour, is concerned with recruitment and placement of farm labour.

The Fur Farms Branch administers the licensing and exporting of live animals and pelts, and assists fur farmers in care, management and stock improvement.

Schools of Agriculture and Home Economics are operated at Olds and Vermilion (see p. 455).

A Radio and Information Branch conducts five broadcasts a week over seven radio stations and issues weekly bulletins to press and radio.

The Water Resources Branch deals with water rights, drainage, irrigation, and water power development.

The Land and Forests Utilization Committee, composed of representatives from the Department of Lands and Forests, Power Commission, Department of Municipal Affairs, University of Alberta and Department of Agriculture, deals with the proper use of submarginal agricultural land.

Credit is made available to young farmers for the purchase of farm lands under the Farm Purchase Credit Act and the Farm Home Improvement Act.

British Columbia.—The Department of Agriculture has four main branches. The Administrative Branch is responsible for the general direction of agricultural policies, administration of legislation affecting agriculture and for the compilation of reports and publications. This Branch also maintains direct supervision of the Field Crops, Soil Survey, Plant Pathology, Entomology, Apiary, Markets and Statistics, Farmers' Institutes and Women's Institutes Branches.

The Livestock Branch engages in the promotion and supervision of the livestock industry and provides veterinary services affecting disease control regulations as well as supervising stock brands, inspection of dairy and fur farm premises, and inspection of beef grading. The Branch also supervises the operations of the Dairy Branch in the inspection of commercial dairy premises. Officials are stationed at 11 centres throughout the province.

The Horticulture Branch supervises fruit, vegetable and seed production, and provides advice on plant diseases and insect pest control. The Branch maintains field offices at 11 points in the southerly section of the province.

The Agricultural Development and Extension Branch offers general information services to farmers through 19 offices which cover all major farming districts. In addition, this Branch provides agricultural engineering service, supervision of the government land clearing program, farm labour services and promotion of junior club projects. The Poultry Section offers extension services to the poultry industry.

Subsection 2.—Agricultural Colleges and Schools

All provinces provide facilities or assistance for training in agricultural science at university level. The colleges and schools are administered by either the Department of Agriculture or the Department of Education of the respective province.

Newfoundland.—There are no agricultural colleges in the province, but the Agriculture Division of the Department of Mines and Resources provides a number of scholarships annually for young men to attend agricultural colleges in other provinces.

Prince Edward Island.—A two-year course in scientific agriculture offered at Prince of Wales College, Charlottetown, prepares students for third year at Macdonald College, Que. In the Vocational School, short courses provide knowledge and skill in agricultural pursuits and develop in the student a sense of the dignity and importance of agriculture as a calling and an understanding of the value of the industry to the province.

Nova Scotia.—The Nova Scotia Agricultural College at Truro offers two courses: the first two years of a degree course in agriculture; and a two-year course in vocational agriculture. The College assists in conducting short courses at various provincial centres, supports Folk Schools and gives direction to 4-H Club organizations. Tuition is free for Canadian students.

New Brunswick.—The four agricultural schools of New Brunswick are located at Woodstock, Fredericton, St. Joseph and St. Basile. Two-term agricultural courses extending over five months each year are offered at Fredericton, St. Joseph and St. Basile and a three-year course is conducted at Woodstock. The curriculum includes training in all phases of agriculture, shop and general academic work. Ten-month home economics courses are also offered at Woodstock and St. Joseph.

Quebec.—Four-year university courses leading to a degree of Bachelor of Science in Agriculture are available through Laval Faculty of Agriculture (Ste. Anne de la Pocatière), L'Institut Agricole d'Oka (affiliated with the University of Montreal), and McGill Faculty of Agriculture (Macdonald College). The Provincial Veterinary School at St. Hyacinthe (affiliated with the University of Montreal) offers a four-year course leading to a Doctorate in veterinary medicine. There are also 17 secondary agricultural schools throughout the province, and five orphanages offer courses in agriculture. More than 1,500 students, the great majority of whom are sons of farmers, attend these intermediate or regional schools of agriculture and 230 pupils follow practical agricultural courses in the orphanages. A farm is always annexed to the school for practical training and specialists give instruction on the maple-sugar industry, farm mechanics, co-operatives, plant protection, veterinary hygiene, aviculture, marketing and silviculture. School co-operatives and clubs are organized and directed by the pupils under supervision. Household science training for the daughters of farmers and settlers is given in nine of these schools.

Ontario.—A two-year course at the Ontario Agricultural College (for the Associate Diploma in Agriculture) provides basic training for young persons interested in making agriculture their vocation. Study includes the application of science to agricultural practice and training for rural citizenship. A four-year course at the same institution for the degree of Bachelor of Science in Agriculture gives fundamental education in the science of agriculture. Sound training is provided for farming as a profession, for entrance into all agricultural services, industry and teaching, and for those who wish to proceed to graduate studies for Master's and Doctorate degrees. Graduate courses are offered leading to the degree of Master of Science in Agriculture. Graduate students are enrolled in a department or departments of the Ontario Agricultural College conjointly with a department or departments of the University of Toronto for advanced courses of study and training in experimentation and scientific investigation. M.S.A. graduates may go into teaching, research, or postgraduate study.

Macdonald Institute offers two main courses in home economics for young women. The one-year course of practical training in the art and science of homemaking earns a diploma of merit but gives no professional standing. The four-year professional course leads to a Bachelor of Household Science degree granted by the University of Toronto. University matriculation standing (nine papers of grade 13) is necessary to enter the four-year course. At its completion, Food Administration Option graduates are eligible to work in the professional dietetic and food-service fields. These graduates and those of the Clothing and Textiles Option and the Home Management Option are finding increasing employment in many areas, notably in the education, extension, business and research fields.

The Ontario Veterinary College offers a five-year course leading to the degree of Doctor of Veterinary Medicine. In addition to its function as a teaching institution, the College is a research centre for animal diseases and provides free consultation for veterinary surgeons in practice as well as extension services in the interests of the live-stock industry.

The Kemptville Agricultural School offers: a diploma course in agriculture, comprised of two six-month terms, giving practical training in modern farming methods and community leadership, and designed primarily for young people who wish to farm but serving also as a preparation for many other occupations closely connected with agriculture; a six-month advanced course in agricultural mechanics for diploma graduates in agriculture; a six-month homemaker course leading to a diploma in homemaking and qualification for positions in fields of home economics; a diploma course comprised of two six-month terms for girls wishing to prepare for positions in the food services, sewing centres, tourist trade and other fields of home economics. In addition, a three-month course is given for dairy apprentices, leading to the Dairy School Diploma required for certified butter-makers, cheesemakers and operators of dairy manufacturing plants. A 450-acre farm and residence life are features of the Kemptville Agricultural School.

The Western Ontario Agricultural School at Ridgeway offers a two-year diploma course (October to April), which gives practical training in modern farming methods and prepares young men to serve agriculture in allied occupations. The facilities comprise a group of modern buildings, including a residence and dining hall, modern classrooms, laboratories, and athletic facilities. There is a 425-acre farm with up-to-date equipment, much of which is used for student activity and for practical demonstrations. A full complement of livestock is maintained on this farm for carrying out the school program.

Manitoba.—The Faculty of Agriculture and Home Economics of the University of Manitoba offers degree courses in agriculture and home economics as well as a two-year, sub-collegiate diploma course in agriculture. Practical short courses in agriculture and homemaking are also given at the Agricultural and Homemaking School at Brandon.

Saskatchewan.—The University of Saskatchewan offers a degree course in agriculture designed to meet the needs of those who intend to teach agriculture in secondary schools or colleges, to engage in research extension or administrative work, or to farm. Specialization is possible with permission of the faculty. Provision is made for combined courses in agriculture and arts or commerce. Postgraduate courses are available.

The Saskatchewan School of Agriculture offers a practical course intended to give sound training in farm practice and also to train young men in rural leadership.

All courses leading to a degree in home economics require four years. The prescribed course of studies for the first two years is the same for all pupils but in the third and fourth years four types are offered: (1) for teachers, (2) for dietitians, (3) general, and (4) additional specializations. A combined course leading to a degree in arts and science and in home economics requires at least five years.

Alberta.—The University of Alberta offers a four-year degree course in agriculture to students with senior matriculation or its equivalent. Students may elect a general program or major in a wide range of special courses in the fields of animal science, economics, entomology, dairying, plant science, and soils. Graduate work at the Master level is offered in all departments and at the Doctorate level in some.

The Alberta Schools of Agriculture and Home Economics, located at Olds and Vermilion, offer practical courses in agriculture and homemaking. The purpose of the schools is to train young men for farming and young women for homemaking. Students must have grade 9 standing for entrance into the regular two-term course. A one-year course is offered to those who have 70 or more high school credits. Living accommodation is provided as well as auditorium and gymnasium facilities.

During the summer months the schools are used for agricultural meetings and conferences of organizations that are connected with agriculture. During the month of July, leadership courses, 4-H Club gatherings, farm camps and other events keep the facilities in constant operation.

British Columbia.—The Faculty of Agriculture at the University of British Columbia offers a four-year general degree course in agriculture and a five-year honours course. In the honours course there are 15 fields in which a student may specialize. Work is also offered by the Faculty of Agriculture in the Faculty of Graduate Studies through which a student may proceed to the degrees of Master of Science in Agriculture and Master of Science; in a limited number of fields, work is offered at the Doctorate level. The Faculty also offers a one-year or two-year diploma course in occupational agriculture, adaptable to the needs of individual students.

In co-operation with various branches of the provincial Department of Agriculture and under the auspices of the University Extension Department, the Faculty of Agriculture also offers a number of short courses which vary in length from one or two days to several weeks.

Section 3.—Agricultural Irrigation and Land Conservation

Subsection 1.—Federal Projects*

Prairie Farm Rehabilitation Act

The PFRA program was instituted by Act of Parliament passed in 1935 to provide for rehabilitation of the drought and soil-drifting areas in the Provinces of Manitoba, Saskatchewan and Alberta. It was later continued in force and its scope enlarged. The Act is designed to promote better utilization of land and to develop surface water resources for stock-watering, domestic use and irrigation of crops.

The administration of the Act is carried out from headquarters at Regina and its programs include water development, community pasture development, rehabilitation and re-settlement of farmers from submarginal lands on irrigated lands, and large-scale irrigation and reclamation projects. Large irrigation and reclamation projects in Western Canada are carried out and financed jointly with the provinces concerned under agreements which set out the responsibilities of each party in the development work. Federal responsibility is administered by the PFRA.

Water Conservation Projects.—As a rehabilitation measure within the drought area of the three Prairie Provinces, PFRA provides engineering and financial assistance to farmers for the construction of water conservation works. The amount of financial assistance awarded is largely dependent upon the type and size of project constructed. Authority to proceed with construction is secured through the respective provincial water rights departments.

During 24 years of operation, PFRA has provided assistance to farmers for the construction of 60,184 individual farm dugouts and small dams, many of which are suitable for irrigation. In this way, adequate water storage facilities are being developed where water shortages exist, thereby extending widely the benefits of water throughout the dry areas of the prairies. By establishing a dependable water supply for domestic use, for stock-watering and for the production of feed and seed through irrigation, many prairie farmers have been rehabilitated without the necessity of moving to a new location.

The development of community water conservation projects is confined to the more well-defined watersheds. Where agricultural groups wish to utilize water on a community basis, PFRA may agree to finance the construction of the capital works provided the province or local organization involved assumes responsibility for the development and maintenance of the project after it has been completed. To Mar. 31, 1959, PFRA pro-

* Prepared under the direction of S. C. Barry, Deputy Minister of Agriculture, Ottawa.

vided the necessary assistance to construct over 400 community projects, the majority of which are located in the six watersheds originating in the three Prairie Provinces. These projects conserve surplus spring run-off water making it available for use during dry periods.

In addition, PFRA has established and continues to administer, five community irrigation projects in the drought area of southwestern Saskatchewan in accordance with the Government of Canada's rehabilitation and re-settlement policies. These projects are located at Val Marie, Eastend, Consul, Maple Creek and Swift Current and obtain their water supply from creeks originating in the Cypress Hills. The irrigable land on these projects is apportioned out in 40- to 60-acre plots to farmers in surrounding districts on the basis of need, for the production of assured livestock feed supplies.

Major Irrigation Projects.—*St. Mary Irrigation Project.*—To make available for irrigation a larger percentage of the water flowing through southern Alberta in the Waterton, Belly, St. Mary and Milk Rivers, a program to extend the original St. Mary Irrigation Project was undertaken by an agreement between the Government of Canada and the Province of Alberta. The Government of Canada agreed to construct the main supply reservoirs and the connecting canals, while the Province of Alberta undertook the responsibility for construction of the irrigation distribution system. When completed, this project will extend irrigation to approximately 510,000 acres of land in the area south of Lethbridge and east beyond Medicine Hat.

Construction of the St. Mary Dam, key structure on the whole project, was completed in 1951. During 1958 the second phase, involving the diversion of the Belly River into the St. Mary Reservoir, was completed. The third step, which is the diverting of the Waterton River into the St. Mary Reservoir by way of the Belly River diversion, is under construction. The present storage and distribution facilities extend irrigation to 296,000 acres of land in the St. Mary Project. With the addition of resources of the Waterton River, a further 214,000 acres of land will be brought under irrigation.

British Columbia Projects.—Irrigation development in British Columbia has been undertaken in connection with the Veterans' Land Act and at the request of the British Columbia Government. Intensive farming is practised in the Okanagan and South Thompson Valleys. The land developed for irrigation by PFRA is used mainly for the growing of small fruits and vegetables and for dairying.

Three irrigation projects in the South Thompson Valley area—the Johnstone Western Canada Ranching Irrigation Projects No. 1 and No. 2, and the Chase Irrigation Project with a total of 809 acres of land—have been developed for the benefit of about 40 veterans of World War II.

In the Okanagan Valley, the Penticton West Bench Project, completed in 1953 to irrigate 205 acres and accommodate 94 veterans, was extended in 1958 to provide an additional 69 small holdings for veterans. Three other irrigation projects have been completed in the Okanagan Valley for the settlement of war veterans—the Cawston Benches project east of the town of Keremeos, and the Westbank and Bankhead projects near Kelowna. Together they provide 1,782 acres of irrigated land for 170 veterans.

Major Reclamation Projects.—*North West Escarpment Reclamation Project.*—At the request of the Manitoba Government extensive investigations have been undertaken by PFRA in the Riding, Duck and Porcupine Mountain areas and Whitemud River watershed, where serious flood and erosion problems exist in an area containing over 252,000 acres of valuable agricultural land. The reclamation work, the cost of which is divided equally between the Government of Canada and the Province of Manitoba, consists of clearing and dyking stream channels, prevention of streambank erosion and aligning channels by building cutoffs and diversions.

Assiniboine River Project.—This project is being undertaken by PFRA at the request of the Manitoba Government to prevent flooding on the Assiniboine River, particularly between Brandon and Virden and between Portage la Prairie and Headingley, where thousands of acres of valuable agricultural land have been inundated repeatedly. A program of dyking and weir cutoffs has been carried out to protect the farm lands from flooding during periods of high river flow. Recently, extensive surveys have been undertaken in the headwaters of the Assiniboine River to locate possible damsites for effective stream flow regulation and flood control in the lower reaches of the Assiniboine River.

South Saskatchewan River Project.—In July 1958 agreement was reached between the Government of Canada and the Province of Saskatchewan to start construction on the South Saskatchewan River Project, a large-scale multi-purpose water conservation project proposed for development in south-central Saskatchewan. The purpose of the project is to make better use of the water resources of the river through irrigation, river control, power, urban water supply, and recreation. Control will be achieved by two dams, the major one on the South Saskatchewan River at a point approximately half-way between the towns of Outlook and Elbow and the other at the divide between the valleys of the South Saskatchewan and Qu'Appelle Rivers. The agreement provides that Canada and Saskatchewan will share the cost of building the dams and all other works associated with the creation of the reservoir; 75 p.c. will be borne by the Federal Government and 25 p.c. by Saskatchewan, the province's share to be not in excess of \$25,000,000. The contribution of the Government of Canada toward the cost of the project is in accord with its long-range resource development plan to provide for expansion and stability in the country's economy.

The project, when completed, will provide water for the irrigation of approximately 500,000 acres of land located in central Saskatchewan on both sides of the South Saskatchewan River between the town of Elbow and the city of Saskatoon and in the Qu'Appelle Valley extending east of Elbow to the Manitoba border. Power installations at the damsite will have a potential output of 475,000,000 kwh.

The reservoir, which will be 140 miles long and will store 8,000,000 acre-feet of water, will be constructed at an estimated cost of \$96,000,000. The main dam will be 210 feet high and of earth fill with an over-all length of 16,700 feet. It will be the largest rolled-earth dam ever built in Canada and one of the largest dams of its kind in the world. Construction was started in the autumn of 1958 and at Dec. 31, 1959 fifteen contracts totalling approximately \$16,000,000 had been let.

Bow River Irrigation Project.—The Bow River Project in Alberta was purchased by the Government of Canada in 1950 from the Canada Land and Irrigation Company, a private British interest. The land associated with this project is being developed for the rehabilitation and re-settlement of farmers from the drought and soil-drifting areas of the Prairie Provinces. Its development will ensure a water supply to 131,000 acres of land at present irrigated, and will make possible the irrigation of an additional 104,000 acres of provincial and privately owned land. The repairing and enlarging of old structures and the construction of new facilities to serve the total acreage is nearing completion.

Red Deer Irrigation Project.—The proposed Red Deer River development concerns the irrigation of an estimated 300,000 acres of land located in the east-central part of Alberta. The project will consist of a dam on the Red Deer River at Ardley and about 100 miles of main canal to two main reservoirs—Craig Lake and Hamilton Lake. The dam will contain power installations to produce power for pumping and also for sale commercially. Capacity is estimated at 20,000,000 kwh.

Saskatchewan River Reclamation Project.—Surveys and investigations were made by PFRA to determine the possibility of successfully reclaiming land for agriculture in the Pasquia area of the Saskatchewan River delta region near the town of The Pas in Manitoba. As a result an agreement was reached early in 1953 between the Government of Canada and the Province of Manitoba for the construction of the necessary reclamation

works to protect the area from flooding and to settle about 100,000 acres of arable land; the Government of Canada will assume the cost of building the main protective works, and Manitoba the costs of settlement, maintenance of works, and internal drainage. One-half of the reclaimed land is to be reserved for the re-settlement of farmers from drought areas and the remainder is to be sold. Part of the proceeds from the sale of the lands will go to the Federal Government as a partial reimbursement of the costs of building the main protective works. Construction began early in 1953 and will be completed in 1960. It is expected that the Manitoba Government will begin settlement of the 100,000 acres immediately.

Lillooet Valley Reclamation Project.—This project was undertaken upon agreement between the Government of Canada, the Government of British Columbia and the Pemberton Valley Reclamation District and is located in the Lillooet River Valley above and below the town of Pemberton. Its objective is to protect lands now under cultivation from flooding and to reclaim additional lands by dyking and drainage. The land so far reclaimed, amounting to 14,000 acres, allowed farmers in the district to increase their holdings and permitted the settlement of hundreds of additional inhabitants.

Land Utilization.—In addition to improved cultural methods and water conservation activities, rehabilitation of drought areas involves the conversion to grass production of large tracts of land that have proven unsuitable for cereal crop production. By agreement with the Provinces of Saskatchewan and Manitoba, these submarginal lands are leased to the Federal Government which agrees to finance the construction, maintenance and improvement of pasture facilities in these areas. The farmers located within the pasture areas are assisted in re-establishing themselves in new locations.

Since the inception of the land utilization program in 1937, a total of 1,815,265 acres of land has been developed into 64 separate community pastures. These pastures make it possible for the farmers in the surrounding area to stabilize their farm income through increased livestock production. During the year ended Mar. 31, 1959, grazing was provided for 117,032 head of livestock owned by 5,835 patrons.

An extensive improvement program in effect on all pastures is begun as soon as new areas are enclosed, a policy that has more than doubled the carrying capacity of this pasture land. The improvement policies most extensively practised in all pastures are the re-grassing of depleted areas, the development of sufficient stock-watering sites, and the following of proven pasture management policies such as controlled grazing and maintaining a 50-p.c. grass carryover where feasible. Since 1938, over 200,000 acres of land in community pastures have been re-grassed, and more than 1,300 stock-watering dams, dugouts, springs and wells have been constructed.

Maritime Marshland Rehabilitation Act Administration (MMRA)

Under the terms of this Act, Canada has undertaken to protect and rehabilitate the tidal marshlands in Nova Scotia, New Brunswick and Prince Edward Island in co-operation with the respective provincial governments. The principal function of MMRA is to carry out these responsibilities by constructing dykes, aboiteaux (tide control dams) and breakwaters to prevent tidal flooding of valuable agricultural lands. Headquarters of the MMRA organization is at Amherst, N.S.

The construction of large structures near the mouths of some rivers to hold back the tides has made it possible to eliminate the need for many miles of dykes and of numerous small aboiteaux. Such structures not only reclaim larger areas of land but very substantially reduce maintenance costs and provide roadways where bridges would otherwise have been required.

By Mar. 31, 1959, the provinces had asked to have over 150 marsh areas with a total area of 94,252 acres included in this reclamation program: Nova Scotia, 52,521 acres; New Brunswick, 41,456 acres; and Prince Edward Island, 275 acres.

As of March 1958, approximately 75,704 acres of marsh were protected from tidal flooding by structures which were either complete or in process of being built or rebuilt. The individual marsh areas form parts of approximately 3,300 farms having a total area of about 500,000 acres.

On the Annapolis River at the town of Annapolis Royal, N.S., and on the Tantramar River near the town of Sackville, N.B., work has been undertaken to dam these tidal rivers to protect large areas of marshlands. Both dams are designed to carry highway traffic, and will be completed in 1960. A similar structure, built on the Shepody River in New Brunswick, has been operating satisfactorily for two years.

Subsection 2.—Provincial Projects

Saskatchewan.*—The Conservation and Development Branch of the provincial Department of Agriculture was established in 1949. Its functions include the administration of water rights; irrigation development, engineering and structures; flood control and drainage; restoration of abandoned, under-utilized and misused lands; and construction of provincial community pastures. Conservation and development activity in the field of agricultural rehabilitation and reclamation is based on co-operation with the Federal Government's PFRA program with which a close working arrangement is maintained. Following is a summary of the activities of the Saskatchewan Department of Agriculture to Mar. 31, 1959.

Water Rights.—Under the Water Rights Act, 5,844 water storage projects for domestic irrigation, municipal, industrial and other like purposes have been licensed, and an additional 330 projects are in the development stage. There are 145 gauging stations being maintained by the federal Water Resources Branch under co-operative agreement to continue hydrometric surveys and a surface water inventory, and records are available for an additional 170 stations. The Chief Engineer of the Water Rights Office represents the Province of Saskatchewan on the Prairie Provinces Water Board.

Irrigation Development.—By the end of March, 1959, 125,708 acres of topographic surveys and 242 miles of profile surveys were completed on irrigation projects; 306 miles of ditch were built and 287 miles maintained; 1,452 structures were installed and 74 maintained; and 7,490 acres were levelled.

Flood Control Development.—Topographic surveys of 146,436 acres and 6,389 miles of profile surveys were completed on drainage projects; 656 miles of ditch and 225 miles of road were built and 157 miles of ditch maintained; 37 miles of dyke were built and 874 structures installed in drainage systems.

Development of Under-utilized and Misused Lands.—A total of 61,015 acres of tame perennial forage crops were seeded, mostly for fodder production; 991 miles of fence and 72 watering sites were built or rebuilt in departmental, municipal or co-operative pastures; 750,000 trees were planted; and 97 conservation and development areas totalling 12,000,000 acres were established.

Community Pastures.—Through the Lands Branch of the provincial Department of Agriculture, the province has transferred title to 1,194,574 acres and leased without charge another 341,876 acres of land to PFRA for community pastures. Outside the PFRA program, the province has another 797,454 acres in 110 community pastures operated by co-operative associations, by municipalities or by the provincial Department of Agriculture; in 1957, 18 pastures operated by the province provided grazing for 17,395 head of cattle owned by 959 local farmers.

Development of Land for Cultivation.—Crown lands, either under cultivation or suitable for cultivation, are leased for a 33-year period. The province may either reimburse farmers in cash for the cost of clearing and breaking virgin land or the farmers may retain crop shares equivalent in value to costs sustained. To Mar. 31, 1958, the investment of

* Revised by the Deputy Minister, Saskatchewan Department of Agriculture.

the province for land clearing and breaking amounted to \$6,528,652, and included work done in six settlement projects involving initial clearing and breaking on about 200 farm units before the land was leased.

Alberta.*—The Alberta Water Resources Act gives the Minister of the Department of Agriculture wide powers to investigate the water resources of the province and extensive surveys have been carried out to determine the distribution and extent of the available water supply in the province and the most beneficial use for irrigation, water power and other purposes. The Water Resources Branch of the provincial Department of Agriculture administers the licensing of water power projects and the construction work in several irrigation projects. Irrigation projects are also licensed and water allocated for domestic and irrigation purposes. Other work includes administration of drainage districts, co-operation on the Peace River Dug-out Project and on river protection projects where flooding occurs. In more recent years much of this work has been carried out by the Federal Government in co-operation with the Government of Alberta.

Stream measurement is being done by the Hydrometric Service of the federal Department of Northern Affairs and National Resources, and irrigation surveys are carried out largely by the water development organization under the PFRA (see p. 456).

In 1958 the Province of Alberta completed the construction of the distribution system for the Western Block of the Bow River Development; the irrigable area is approximately 45,000 acres.

The figures given in Table 5 of land actually irrigated in Alberta in 1958 are only approximate because, while there are increases resulting from the creation of new pump irrigated areas, there are also decreases caused by soil reclassification and less water use, depending on natural precipitation. Seepage and alkali problems also have an effect on acreage quoted as irrigable. Figures for small private irrigation projects have been omitted because of their uncertain water supply.

Gross cash returns from the irrigable area are estimated at \$30,000,000 though this figure does not take into account the value of stockwater supplied through irrigation works. Nor does it include many other credit items that are difficult to evaluate such as the recreational use of water which, to these one-time semi-arid areas, is particularly important, and the value of fish taken from irrigation reservoirs which is known to be quite significant. Several communities receive their entire domestic water supply via irrigation canals.

* Revised in the Deputy Minister's office, Alberta Department of Agriculture.

British Columbia.*—About 20 p.c. of the arable land in British Columbia is under cultivation and nearly all the grazing area is being utilized. The 1,300,000 acres of improved land gives a ratio of approximately one acre per person. Within this arable area there exist an estimated 216,000 acres of irrigated land, and the total acreage of irrigable land in British Columbia is estimated at 400,000 acres. About three-quarters of the irrigated area is made up of individual projects and the other quarter is served by the larger irrigation projects listed in Table 6.

* Revised by the Comptroller of Water Rights, British Columbia Department of Lands and Forests.

Section 4.—Statistics of Agriculture*

The collection, compilation and publication of statistics relating to agriculture is a responsibility of the Dominion Bureau of Statistics. Valuable information obtained through the Censuses of Canada and partial-coverage surveys may be obtained in reports issued by the Bureau.†

The Bureau also collects and publishes primary and secondary statistics of agriculture on an annual and monthly basis. The primary statistics relate mainly to the reporting of crop conditions, crop and livestock estimates, values of farm lands, wages of farm labour and prices received by farmers for their products. The secondary statistics relate to the marketing of grain and livestock, dairying, milling and sugar industries and cold storage holdings.

In the collection of annual and monthly statistics, the federal Department of Agriculture and the provincial Departments of Agriculture, as well as such agencies as the Board of Grain Commissioners and the Canadian Wheat Board, co-operate with the Bureau. Also, many thousands of farmers throughout Canada send in reports voluntarily.

The figures (except for 1956 Census data) contained in this Section do not include estimates for Newfoundland. Agriculture plays a relatively minor part in Newfoundland's economy, commercial production of most agricultural products being quite small.

A review of agricultural production and trade covering 1959 is given in Subsection 1; details for the year 1958 are presented in Subsections 2 to 9.

Subsection 1.—Review of Agricultural Production and Trade, 1959

During 1959 Canada made a further advance in the economic recovery and expansion that began in 1958. For the year as a whole, the gross national product averaged about 6 p.c. above the year 1958 and, with final product prices higher by about 2 p.c., it is estimated that the physical volume of output in 1959 was 4 p.c. above that of the preceding year. The physical volume of agricultural output, however, fell slightly in 1959 from

* Revised in the Agriculture Division, Dominion Bureau of Statistics.

† Copies obtainable from the Dominion Statistician or the Queen's Printer, Ottawa.

1958 to a level almost identical with the five-year average (1954-58). Production increases for such important items as grains, livestock and dairy products in 1959 over 1958 were not large enough to completely offset the decline estimated for most of the remaining agricultural products.

Farm cash income at \$2,786,000,000 for 1959 was slightly below the 1958 estimate of \$2,813,000,000. Farm operating and depreciation charges continued to move upward in 1959, accounted for by increases in outlays for each of the items considered in the expenditures. The slight decline in cash income coupled with the increase of 5 p.c. in farm expenditures and a continued decline in farm inventories of grain resulted in a drop in net farm income from \$1,353,000,000 for 1958 to \$1,192,000,000 for 1959. The 1959 net income estimate was, however, higher than the 1957 estimate of \$1,058,000,000.

Field Crops.—Canada's 1959 *wheat* crop amounted to 413,500,000 bu., compared with the 1958 crop of 371,700,000 bu. and the 1957 crop of 385,500,000 bu. Total supplies of wheat in the 1959-60 crop year (carryover at July 31 plus the 1959 crop) amounted to 962,500,000 bu. compared with 1,011,200,000 bu. the previous year. The 1959 *oat* crop of 417,900,000 bu. was 17,000,000 bu. larger than in the preceding year while production of *barley* at 225,600,000 bu. was below the 1958 level of 244,800,000 bu. Total supplies of oats and barley for the 1959-60 crop year amounted to 536,900,000 bu. and 353,700,000 bu. respectively. The combined fall and spring *rye* crop was estimated at 8,100,000 bu., giving total supplies for the 1959-60 crop year of 16,100,000 bu.

Owing to the combined effect of reduced carryover stocks of oats and rye and a smaller barley crop in 1959, total supplies of Canadian *feed grains* in the crop year 1959-60 were about 5 p.c. below those of 1958-59 despite higher levels of production for oats, rye and corn for grain. Current crop year supplies of oats, consisting of the Aug. 1 carryover of 119,300,000 bu. and the 1959 production of 417,900,000 bu., amounted to 537,200,000 bu., representing a decrease of 3 p.c. from the 1958-59 total of 555,900,000 bu. Supplies of barley at 352,700,000 bu. were 3 p.c. less than the 1958 total of 362,900,000 bu. and consisted of a carryover of 127,100,000 bu. and a crop of 225,600,000 bu.

Net supplies of feed grains available in 1959-60 at 16,600,000 tons were about 6 p.c. less than the 1958-59 total of 17,600,000 tons. Relative to livestock, the net supply of feed grain per grain-consuming animal unit was placed at 0.94 tons, the lowest level since 1954-55 and a decline of 9 p.c. from the 1958-59 level. This decline reflected the combined effect of decreased feed supplies and a 3-p.c. increase in grain-consuming animal units. The livestock population in Canada, estimated as at June 1, 1959, was the equivalent of 17,600,000 grain-consuming animal units compared with the June 1, 1958 level of 17,100,000.

Production of *sugar beets* in 1959 was estimated at 1,240,000 tons compared with the 1958 record outturn of 1,325,000 tons. Average yields per acre were a record high of 13.70 tons in 1959, slightly better than the 1958 yield of 13.54 tons. Alberta accounted for 38 p.c. of the total production and Ontario was the next largest producer. The national average farm price during 1958-59 was \$14.47 a ton.

The *dried pea* crop of 984,000 bu. in 1959 reflected the combined effect of reductions in both seeded acreage and yield. Imports amounted to 57,200 bu. and exports to 445,000 bu. in the 1958-59 crop year. Production of *dried beans* was 1,168,000 bu., Ontario being the chief grower. Exports in the 1958-59 crop year were 61,700 bu., down 39 p.c. from 1958, and imports were slightly lower at 138,500 bu.

The *soybean* crop of 6,800,000 bu. in 1959 was larger than the 1958 crop of 6,649,000 bu. In the 1958-59 crop year, 155,000,000 lb. of oil and 706,000,000 lb. of oil meal were produced in Canada. Imports of soybeans, mostly from the United States, amounted to 13,000,000 bu. and exports, mostly to the United Kingdom, were 2,000,000 bu. The national average farm price for the 1958-59 season was \$1.88 per bu.

The *flaxseed* crop at 21,200,000 bu. was about 7 p.c. below the 1958 production. Although acreage sown was down by 9 p.c., the average yield increased from 8.7 bu. per acre to 8.9 bu. Total supplies in the 1959-60 crop year were estimated at 27,800,000 bu.

Crushings in 1958-59 of 184,900,000 lb. of flaxseed yielded 64,400,000 lb. of linseed oil and 114,500,000 lb. of oil meal. Exports at 14,300,000 bu. were higher than in the previous year.

Livestock.—A very sharp increase of 27 p.c. in output of hogs was the most striking development in the livestock situation in 1959. Commercial marketings of hogs rose from 6,467,000 head in 1958 to 8,571,000 in 1959, closely approaching the record of 8,864,000 reached in 1944 when wartime production of hogs was at its peak in Canada. Output of cattle and calves dropped appreciably from 1958 when export demand from the United States was high. Exports of live cattle and calves dropped from 670,500 in 1958 to 342,700 in 1959.

Total meat output from slaughter in Canada at 2,611,000,000 lb. was 8.5 p.c. greater than in 1948 and per capita disappearance of the red meats increased 5.3 lb. to 143.3 lb., which was 9.5 lb. per capita more than the average annual disappearance in the period 1951-55. Exports of meat were almost 125,000,000 lb., equal to the 1951-55 average but 24,000,000 lb. less than in 1958.

Cattle numbers rose almost 4 p.c. from 10,112,000 head at Dec. 1, 1958 to 10,489,000 head, largely attributable to a continued build-up of beef cow numbers and a significantly larger inventory of calves. Numbers of sheep also rose 4 p.c. from Dec. 1, 1958 and hogs, after heavy marketings, declined 7 p.c. from year-earlier totals by Dec. 1, 1959. Price movements are reflected by the following annual average calculations of Toronto prices, 1958 prices in brackets: good steers, \$25.10 (\$22.90); good feeder steers, \$25.10 (\$23.50); good lambs, \$21.15 (\$22.35); and grade B hogs, \$23.80 (\$28.15).

Dairying.—Milk production in 1959 reached a new record at 18,192,000,000 lb., about 1 p.c. higher than the 1958 output. Increases in Prince Edward Island, Nova Scotia, Ontario and British Columbia more than offset, to that extent, decreases in the other provinces. Most of the increase in 1959 over 1958 was consumed as fluid milk and cream. The output of creamery butter was down by 3 p.c. to 325,300,000 lb. but factory cheese rose about 16 p.c. to 118,600,000 lb.

Annual per capita consumption of butter declined about 1 lb. for each of the years 1958 and 1959. As a result, despite lower production and exports that increased from 4,800 lb. to 10,504,000 lb., creamery butter stocks on hand at the end of 1959 amounted to 105,473,000 lb. and were 12.5 p.c. higher than at the end of 1958.

Concentrated whole milk production increased moderately in 1959. Output is normally slightly in excess of domestic requirements but increasing population and relatively stable per capita consumption and exports keep the supply in balance. Skim milk powder production declined almost 10,000,000 lb. from the high 1958 output of 185,600,000, but exports of 110,500,000 lb. and increased domestic disappearance largely liquidated surplus stocks on hand at the end of the year. Domestic disappearance of this product rose from 81,700,000 lb. in 1956 to 121,200,000 lb. in 1959.

Fruits and Vegetables.—All fruit crops except loganberries were smaller in 1959 than in 1958 when totals were influenced by higher-than-average crops in Ontario. Minimum prices for fruits for processing were at the same levels as in 1958 or higher. The apple crop, which is the most important of the fruit crops, was estimated at 14,500,000 bu., 15 p.c. below the 1958 output. Declines were recorded by all provinces except Nova Scotia and New Brunswick.

Commercial vegetable growers planted 204,000 acres in 1959 as compared with 202,000 acres in 1958.

Other Principal Farm Products.—The 1959 tobacco crop was estimated at 170,255,000 lb., green weight, compared with 197,302,000 lb. in 1958. Ontario flue-cured tobacco was calculated at 147,000,000 lb. as against 176,322,000 lb. in 1958. About 129,000 acres were planted to tobacco, 119,000 acres in southern Ontario which was 6,000 acres less than in the previous year. In 1959 the Ontario Flue-cured Tobacco

Growers' Marketing Board reduced the basic acreage allotment per farm by 15 p.c. after allowing a basic exemption per farm of 15 p.c. and allotting acreage to more than one hundred new farms. It is interesting to note that research has made possible the raising of tobacco in the Ottawa Valley of Ontario and in the Annapolis Valley of Nova Scotia; so far production in these areas is on a small scale.

The per capita cigarette consumption in Canada, calculated on the basis of total population, has increased considerably during the past few years, amounting to 1,678 in 1956, 1,817 in 1957, 1,901 in 1958, and 1,939 in 1959.

The *potato* crop, estimated at about 35,290,000 cwt. for 1959, recorded a decline of 12 p.c. from the 1958 crop of 40,301,000 cwt.

More *eggs* were marketed through registered stations in 1959 than in 1958. Heavier marketings occurred in all provinces except Alberta, Saskatchewan and Prince Edward Island. Reflecting this situation, egg prices were lower in all provinces than in the previous year. Egg price support to producers by means of deficiency payments under the Agricultural Stabilization Act began with the marketing year commencing Oct. 1, 1959.

Wool prices rose slightly from 1958 to 1959, but payment under the Agricultural Stabilization Act was lowered from 28 to 21 cents per lb. This resulted in a drop in the average farm value to 43.6 cents per lb. from 48.1 cents per lb. in 1958. Total farm value of shorn wool production decreased from \$3,053,000 to \$2,966,000. Production was estimated at 6,800,000 lb. as compared with 6,345,000 lb. in 1958.

The 1959 *maple* crop, expressed as syrup, was estimated at 2,358,000 gal., about 5 p.c. below that of 1958 and 8 p.c. below the average production for the years 1952-56. The bulk of the crop was produced in the Province of Quebec. Exports of sugar in 1959 stood at 7,400,000 lb., nearly 20 p.c. higher than in the previous year. The value of the 1958 maple crop was estimated at \$8,440,000, 18 p.c. less than in 1957 when production was larger than average.

The 1959 *honey* crop was estimated at 33,233,000 lb., 21 p.c. above that of 1958. The substantial increase in production resulted from much higher average yields—101 lb. per colony in 1959 compared to 83 lb. in 1958 and an average of 78 lb. for the years 1948 to 1957. Although there was a small increase in the number of active beekeepers from 13,150 in 1958 to 13,590 in 1959, colony numbers declined by 4,000 to a total of 328,700 in 1959.

Subsection 2.—Cash Income from the Sale of Farm Products, 1958*

Returns to farmers from the sale of farm products, together with participation payments from previous years' grain crops, were estimated at a near record high of \$2,800,000,000 for 1958. This estimate exceeded that of 1957 by 8 p.c. and was only slightly lower than the 1952 estimate of \$2,900,000,000, the highest recorded to date. Most of the increase in cash farm income in 1958 compared with 1957 may be attributed to larger returns from the sale of livestock and animal products; returns from the sale of field crops were about the same as in the previous year.

Each of the nine provinces contributed to the higher farm cash income in 1958. In Eastern Canada, receipts from field crops and livestock and animal products were responsible for the increase; in Western Canada the higher returns came from sales of livestock and animal products only. Total returns from the sale of field crops were lower than in 1957 for each of the three Prairie Provinces and for British Columbia, but these declines were offset by higher returns from field crops in Eastern Canada.

Field Crops.—Returns from the sale of wheat were estimated at \$427,000,000 for 1958, almost \$50,000,000 higher than a year earlier. Larger farm marketings to fill greater export demand was the principal factor affecting receipts in 1958; average farm prices were also higher, though this was attributed to quality since the initial payments to wheat

* Excludes Newfoundland.

growers for specific grades in 1958 were the same as those in 1957. Slightly higher returns from the sale of barley and rye were also the result of larger marketings since farm prices for these crops were practically the same in 1958 as in 1957.

The effects of the higher returns from wheat, rye and barley were offset by lower returns from flax, oats and Canadian Wheat Board participation payments. Reduced farm marketings in 1958 were responsible for the smaller returns from the sale of flax and oats compared with 1957.

In Eastern Canada the higher returns from field crops may be attributed mainly to potatoes, tobacco and sugar beets. Potato growers in Prince Edward Island and New Brunswick received about one-fifth more for their potato crops in 1958 than in 1957. In Ontario the higher returns accrued largely to tobacco and sugar beet growers.

Livestock and Animal Products.—Receipts from the sale of livestock and animal products were estimated at \$1,700,000,000, a record high amount 14 p.c. above the estimate for 1957. Receipts were higher in each of the nine provinces included in the national farm accounts, the increases being attributed mainly to larger returns from the sale of cattle and calves. For the country as a whole, cash farm income derived from the sale of cattle and calves was about one-quarter larger in 1958 than in 1957, a result of the combined effects of higher prices and larger marketings.

Hog growers throughout Canada received more cash from the sale of their product in 1958 than in 1957, larger marketings offsetting the effects of lower prices. Income from hog sales was estimated at \$325,000,000 in the later year, an amount 11 p.c. higher than the 1957 estimate and exceeded only in 1951 and 1952.

Sales of dairy products brought an estimated \$495,000,000 to farmers in 1958, almost 8 p.c. more than in 1957. This record amount in 1958 was attributable both to larger marketings and to a slight increase in average farm prices for milk as compared with 1957.

Supplementary Payments.—Following the 1957 drought in the Prairie Provinces, payments of over \$20,000,000 were made to prairie farmers under the Prairie Farm Assistance Act early in 1958. These payments were augmented to the extent of about \$40,000,000 under the Western Grain Producers Payment Regulations (Order in Council PC 1958/1442). (See p. 442.)

Net Income of Farm Operators from Farming Operations, 1958.—Net income of Canadian farmers (exclusive of those in Newfoundland) was estimated at \$1,300,000,000 for 1958, a figure 20 p.c. higher than the 1957 estimate and approximately the same as the average for the five years 1953-57. With the exception of Nova Scotia and New Brunswick, provincial net income estimates were above 1957 levels, largely as a result of increased receipts from the sale of farm production. These larger cash receipts were, however, somewhat tempered by higher farm operating and depreciation charges and by a decline in year-end inventory values. Higher farm operating costs resulted from a combination of slightly higher prices and the use of more goods and services.

9.—Net Income of Farm Operators from Farming Operations, 1956-58

(Exclusive of Newfoundland)

NOTE.—Includes estimated value of farm homes, supplementary payments made under the provisions of the Prairie Farm Assistance Act and, in 1958, payments under the Western Grain Producers Acreage Payment Regulations.

Subsection 3.—Volume of Agricultural Production

The index of physical volume of agricultural production for Canada (exclusive of Newfoundland) was estimated at 139.4 (1935-39=100) for 1958, which was 4.3 p.c. above the estimate of 133.6 for 1957 but 17.8 p.c. below the all-time high of 169.5 established in 1956. Most of the commodities considered in the index, particularly livestock, contributed to the increase between 1957 and 1958, but the substantial reduction in these two years compared with 1956 was almost entirely accounted for by a significantly smaller production of grain.

Provincially, gains in agricultural production were recorded for all provinces except the Maritimes and Saskatchewan in 1958 over 1957. The increases ranged from just under 2 p.c. in British Columbia to approximately 15 p.c. in Manitoba; reductions in the Maritimes and Saskatchewan were between 6 and 7 p.c.

11.—Index Numbers of Physical Volume of Agricultural Production, by Province, 1949-58

(1935-39=100. Exclusive of Newfoundland)

NOTE.—For a description of this index, methods and coverage, see DBS *Quarterly Bulletin of Agricultural Statistics* for April-June, 1952. Figures for 1935-44 are given in the 1950 Year Book, p. 420, and for 1945-48 in the 1956 edition, p. 423.

Year	P.E.I.	N.S.	N.B.	Que.	Ont.	Man.	Sask.	Alta.	B.C.	Total

Subsection 4.—Field Crops

Crop conditions across Canada were variable in 1958. In the Prairie Provinces, where drought was experienced for the second consecutive year, crops turned out exceptionally well. Hail losses were light and losses from rust were negligible but insect outbreaks required extensive control measures. Dry weather also prevailed in parts of British Columbia while in the Maritimes and Quebec the weather ranged from normal to too much moisture and cool weather in some areas. Although the growing season was dry over the main producing areas of Ontario, cool weather and timely rains, coupled with new high-yielding varieties of many crops, pushed yields of most small grains to record levels. Canadian production of field crops in 1958, on the average, did not differ greatly from that of the previous year. New production records were established for soybeans and sugar beets.

Marketings of the five major grains (wheat, oats, barley, rye and flaxseed) in the Prairie Provinces totalled 576,021,000 bu. in 1957-58 and 551,977,446 bu. in the 1958-59 crop year. These amounts were well below the record 1952-53 year when marketings reached 844,855,000 bu. but compared favourably with the ten-year (1947-48 to 1956-57) average of 578,380,000 bu. Combined exports of the same grains (including wheat flour, rolled oats and oatmeal, malt, and pot and pearl barley) amounted to 445,870,000 bu. in 1957-58 and 390,000,000 bu. in 1958-59. Exports during the period were above the ten-year average of 382,225,000 bu.

After registering a decrease in 1957-58, supplies of the five principal grains declined again in 1958-59, with reduced carryover more than offsetting a relatively small increase in total production. Reflecting the combined effect of smaller available supplies and expanded disappearance, total carryover stocks at July 31, 1959 were drawn down from the 1958 level.

The gross value of production of principal field crops on Canadian farms in 1957, based on average prices received by farmers throughout the 1957-58 crop year, was estimated at \$1,473,203,000. On the basis of partial price returns and reflecting reduced crop production, the 1958 value decreased slightly to \$1,460,983,000. These amounts were well below the record-breaking year of 1952 when the total reached \$2,306,397,000, and the 1951 total of \$2,120,301,000. Estimates of the value of the 1958 crops, based on average prices received by farmers during the complete crop year, will be published in one of the regularly scheduled DBS crop reports and in the *Quarterly Bulletin of Agricultural Statistics* (Catalogue No. 21-003).

12.—Acreages, Yields and Prices of Principal Field Crops 1953-58, with Five-Year Average 1945-49

Stocks of Grain in Canada.—Table 15 shows the stocks of Canadian grain on hand in Canada and in the United States on July 31 for the years 1953-58, with averages for the five-year periods 1940-44 and 1945-49. Stocks in Canada are separated into

those in commercial positions and those on farms. Stocks on farms and in country elevators in the Prairie Provinces are given separately.

15.—Carryover of Canadian Grain as at July 31, 1953-58, with Five-Year Averages 1940-44 and 1945-49

NOTE.—Figures for individual years before 1953 will be found in the corresponding table of previous editions of the Year Book. Some of the figures in this table have been revised since the publication of the 1959 edition.

The federal Department of Agriculture inspects all livestock in plants designated as inspected establishments under the Meat and Canned Foods Act. A record is kept of these inspections and figures from 1944 are given in Table 18. Local wholesale butcherings and slaughterings carried out by retail butchers and by farmers for their own use are not included. Actually the slaughtering and meat packing industry is concentrated in a comparatively small number of large establishments to facilitate greater efficiency and utilization of products; thus the figures of Table 18 are fairly inclusive. The slaughtering and meat packing industry is dealt with in its proper relation to all other manufacturing enterprises in Chapter XIV of this volume. On a gross value basis it normally ranks among the three largest manufacturing industries in Canada but it owes its importance to the value of raw products obtained from the farmer and the rancher rather than to the value added by the manufacturing process.

Subsection 6.—Dairying

Milk Production.—Milk production in 1959 amounted to 18,191,963,000 lb., an increase of 138,080,000 lb. over production in the previous year. The proportion of the total milk production used for factory-made dairy products was 58.0 p.c. compared with 58.4 p.c. in 1958 and the proportion sold in fluid form 30.9 p.c. compared with 30.4 p.c. Milk used for all purposes on farms (home consumed, manufactured and fed) was 11.1 p.c. in 1959 compared with 11.2 p.c. in 1958.

Butter, Cheese and Other Dairy Products.—Butter production in 1959 amounted to 338,548,000 lb., 11,356,000 lb. fewer than in 1958. The total included 325,300,000 lb. of creamery butter, 10,526,000 lb. of dairy or farm-made butter and 2,722,000 lb. of whey butter.

The 1959 factory cheese production was estimated at 118,568,000 lb., an increase of 16.6 p.c. over the 1958 estimate but 42.8 p.c. below the peak production of 207,431,000 lb. in 1942. Exports of cheese, mostly cheddar, amounted to 20,009,000 lb. in 1959 and 15,701,000 lb. in 1958 as compared with 135,409,000 lb. in 1945.

The over-all production of concentrated milk products in 1959 amounted to 584,330,000 lb., 1,987,000 lb. fewer than in 1958 but the production of ice cream continued its upward trend, reaching over 40,000,000 gal.

Domestic Disappearance of Dairy Products.—The estimated consumption of fluid milk and cream, on a milk basis, amounted to 5,185,852,000 pt. in 1959, which amount was 85,908,000 pt. higher than the 1958 consumption. The daily average consumption per capita remained the same at 0.84 pt. The estimated consumption of milk and cream is given by province in Table 26 and the domestic disappearance of all dairy products in Table 27.

¹ Includes Newfoundland for all manufactured dairy products.

malted milk, cream powder, partly skimmed evaporated milk, whole milk powder of less than 26 p.c. fat, formula milks, evaporated milk of 2 p.c. fat and sterilized cream.

² Includes, in addition to the items listed, i.e., condensed buttermilk, powdered buttermilk, sugar of milk, casein, powdered whey and special formula skim milk products. Since the quantities used for human consumption and livestock feeding cannot be separated, per capita figures include both.³ Includes milk by-products items not listed.⁴ Includes ice cream in terms of milk.

Subsection 7.—Fruits and Vegetables

Fruits.—Commercial fruit growing in Canada is confined almost exclusively to rather limited areas in the Provinces of Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia. Nova Scotia production is centred mainly in the Annapolis Valley and New Brunswick production in the St. John River Valley and Westmorland County. The fruit growing districts of Quebec are the Montreal area, the North Shore area, the Eastern Townships and the Quebec City district. Ontario fruit is grown in all the counties adjacent to the St. Lawrence River and the Great Lakes as far west as Georgian Bay, the Niagara district being the most productive. In British Columbia the four well-defined fruit areas are the Okanagan Valley, the Fraser Valley, the Kootenay and Arrow Lakes district and Vancouver Island. The climate elsewhere in Canada is not generally suitable for commercial tree-fruit culture. In most producing areas, particularly in the Annapolis Valley of Nova Scotia, the Niagara Peninsula of Ontario and the Okanagan Valley of British Columbia, fruit growing is either the principal or one of the most important forms of agriculture and is of paramount importance to the economy of those areas. Apples and small fruits are produced commercially in the provinces named but tender tree fruits and commercial vineyards are largely limited to Ontario and British Columbia.

Strawberries are grown commercially in all provinces for which tree-fruit statistics are prepared, as well as in Prince Edward Island. However, this crop is produced over a somewhat wider area than are tree fruits. In Nova Scotia, for example, considerable quantities of strawberries are grown in Colchester County and farther north as well as

in the apple producing areas of the Annapolis Valley. In British Columbia most of the strawberries are grown in the Fraser Valley rather than in the predominantly tree-fruit producing area of the Okanagan Valley.

Raspberries are grown commercially in Nova Scotia, New Brunswick and Quebec but the bulk of the crop is produced in Ontario and British Columbia. The Fraser Valley of British Columbia is the most important producing area.

Wild blueberries are harvested on a commercial scale in Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick and Quebec. This crop is indigenous to certain lands in these areas. Individuals who harvest the wild berries may undertake to burn the land from time to time for weed control and to effect pruning. Dusting is often carried out to control insects, and bees are sometimes introduced to secure better pollination. A large percentage of the crop is frozen and exported. Some blueberries are picked for sale in other provinces but no statistics of this trade are available. There is also some production of cultivated blueberries, particularly in British Columbia.

A marketing system has been developed for distributing fresh fruit from the specialized production areas to all parts of the country and a large proportion of the deciduous fruit consumed in Canada is grown domestically. Considerable quantities of apples, strawberries and blueberries are exported annually.

Canning and processing industries have developed in the fruit growing districts and, although the importance of the processing market varies with different fruits, it provides a valuable outlet for substantial proportions of most Canadian-grown fruit crops.

¹ Farm value (to pickers in the case of blueberries) for unpacked fruit.

Vegetables.—Estimates of acreage and production of commercial vegetables in Canada are prepared for all provinces except Newfoundland, Prince Edward Island and Saskatchewan. The Province of Ontario is the largest producer, followed by Quebec and British Columbia. A wide variety of crops is grown in these three provinces while a somewhat smaller range of crops is produced in the Maritimes and in the Prairie Provinces.

Canning, freezing and processing of vegetables are carried on in the important producing areas. The estimates in the following tables cover output of commercial growers only and do not include any acreages or production of vegetables grown for home use on farms or elsewhere.

Subsection 8.—Other Principal Farm Products

Tobacco.—The chief tobacco growing area of Canada is located in southern Ontario in the counties adjacent to Lake Erie. Most of the cigarette tobacco comes from this district. In Ontario in 1958, 117,274 acres of flue-cured or Bright Virginia type tobacco and 7,024 acres of Burley tobacco were harvested. These are the most important types grown in Canada though dark air-cured and fire-cured tobacco as well as cigar tobacco are grown on a limited scale. The only other important production comes from Quebec. In 1958, 5,588 acres of flue-cured tobacco, 3,085 acres of cigar tobacco and 569 acres of pipe tobacco were harvested in that province.

A study of Department of National Revenue reports on tax-paid withdrawals of tobacco products reveals changes in the smoking habits of Canadians during the past three decades. In 1922, the first year for which comparable figures are available, Canadian per capita consumption of cigarettes was 229, cigars 20, cut tobacco 1.3 lb., plug tobacco 1.1 lb. and snuff about 1.3 oz. By 1958 the annual per capita consumption of cigarettes had increased to 1,901, cigars had increased slightly over the previous year to 18.9, cut tobacco went up to 1.6 lb. in 1954 but declined to 1.2 in 1958, and plug tobacco had declined considerably.

Sugar Beets and Beetroot Sugar.—Sugar beets are grown commercially in Quebec, Ontario, Manitoba and Alberta and beet sugar factories are located in these provinces. In Quebec, commercial production is centred in the St. Hilaire area of the Eastern Townships and in Ontario is confined largely to the southwestern section of the province; factories are located at Wallaceburg and Chatham. Alberta produces the largest crop and, because in that province sugar beets are grown under irrigation, yields average above those in the other provinces.

Eggs.—The net production of eggs in 1958 was 449,819,000 doz. which was 3,343,000 doz. more than in the previous year. This increase occurred because the moderate decrease in the number of layers was more than offset by an increase in the rate of lay. Domestic disappearance, not including hatching eggs, amounted to 423,404,000 doz. as compared with 421,098,000 doz. in 1957. Per capita consumption for the year 1958 was 24.8 doz.

³ Average value at farms for all purposes.

Wool.—Canada's wool requirements are met largely by imports which amounted to 42,209,000 lb. (greasy basis) in 1958 and 47,331,000 lb. in 1957. Exports amounted to 4,002,000 lb. in 1958 and 3,917,000 lb. in 1957. The apparent domestic consumption of wool shown in Table 36 is determined on the basis of production, exports and imports but does not take into consideration changes in stocks for which the data are not available. Differences in wool utilization from year to year are therefore probably less marked than indicated by these figures.

Honey.—Honey is produced commercially in all provinces of Canada except Newfoundland, Ontario being the largest producer. There is a considerable movement of honey from the Prairie Provinces to other parts of Canada. In recent years exports have been small, imports being higher than exports.

Honey statistics have been compiled on an all-Canada basis since 1924 and show that the largest recorded crop was in 1948 when 45,145,000 lb. were produced. Production in 1958 was 27,509,000 lb.

In order to facilitate storage, shipment and uniformity of quality, considerable quantities of Canadian honey are pasteurized. Beekeepers' marketing co-operatives are active in several provinces. Bees are kept in some of the fruit growing districts mainly for purposes of pollination.

Maple Sugar and Syrup.—Maple syrup is produced in the Provinces of Nova Scotia, New Brunswick, Quebec and Ontario. The bulk of the crop comes from the Eastern Townships of Quebec, a district famous both in Canada and the United States as the centre of the maple products industry. Virtually all of the maple products exported are sent to the United States with the larger proportion moving as sugar, although substantial quantities of syrup are also shipped.

Much of the syrup sold in Canada is marketed in one-gallon cans direct to the consumer from the producer but a considerable amount of both sugar and syrup is sold each year to processing firms.

Nursery Stock.—Statistics concerning the nursery industry in Canada for the eighteen-month period ended Dec. 31, 1957 and for the calendar year 1958 are presented in Tables 40 and 41. All nurseries were asked to report quantities sold of stock propagated or imported during these periods. Stock purchased from other nurseries in Canada was excluded to prevent duplication. A total of 279 nurseries reported shipments in 1958 as compared with 269 the previous season. Provincial distribution was as follows: Ontario 147, British Columbia 55, Quebec 32, Manitoba 15, the Maritime Provinces 13, Alberta 10 and Saskatchewan 7.

Subsection 9.—Prices of Agricultural Produce

The monthly index of farm prices of agricultural products was designed to measure changes occurring in the average prices farmers receive at the farm from the sale of farm products. In comparing current index numbers with those before August 1957, certain points should be considered. Western grain prices used in the construction of the index before Aug. 1, 1957 are final prices for all grains. Since Aug. 1, 1958, only initial prices are available for western wheat, oats and barley. Any subsequent participation payments made on the 1958 crops will be added to the prices currently used and the index revised upward accordingly.

42.—Average Index Numbers of Farm Prices of Agricultural Products, by Province, 1950-58 and Monthly Indexes for 1957 and 1958

(1935-39=100)

NOTE.—A description of this index, its coverage and the methods used will be found in *DBS Quarterly Bulletin of Agricultural Statistics* (Catalogue No. 21-003) for October-December 1946.

¹ All weights; beginning in 1958 prices for steers are not classified by weight.² No sales reported.

Subsection 10.—Food Consumption

Food consumption figures represent available supplies, including production and imports, adjusted for change of stocks, exports, marketing losses and industrial uses. All calculations are made at the retail stage of distribution, except for meats for which the figures are worked out at the wholesale stage. The amount of food actually eaten would be somewhat lower than indicated because of losses and waste occurring after the products

reach the hands of the consumer. It should also be pointed out that there are minor inaccuracies in certain of the figures since statistics of storage stocks in the hands of retailers and consumers are not available.

All basic foods are classified under 13 main commodity groups. The total for each group is computed using a common denominator for the group, for example: milk solids (dry weight) in the dairy products group; fat content for fats and oils; and fresh equivalent for fruits. All foods are included in their basic form, that is, as flour, fat, sugar, etc., rather than in more highly manufactured forms.

The series in Table 45 represents the official estimates of yearly supplies of food moving into consumption, expressed in pounds per capita, for the years 1935-39 as an average for comparison with the years 1956, 1957 and 1958.

45.—Per Capita Supplies of Food Moving into Consumption 1956-58, with Average for 1935-39

NOTE.—Many of the figures for 1956 and 1957 have been revised since the publication of the 1959 Year Book.

¹ Fluctuations in apparent per capita flour consumption are caused partly by lack of complete data on flour inventories in all positions. ² Includes soybean flour. ³ Exclusive of Newfoundland. ⁴ Break-down according to current classification not available. ⁵ Includes process cheese. ⁶ Includes cream expressed as milk.

Disappearance of Meats and Lard.—Production of meats from slaughter in Canada, total supply, distribution and per capita disappearance of meats and lard are shown in Table 46. All estimates are on a carcass-weight basis except canned meats which are in terms of product.

¹ Excluding canned meats. ² Included with beef. ³ Includes commercial lard production and estimated lard equivalent of renderable pork fat available from all uninspected slaughter.

Section 5.—Agricultural Statistics of the Census*

Census of Agriculture statistics relating to farms, farm mechanization, electrification and area are included in this Section. More detailed information may be obtained from the *Census of Canada 1956*, Volume II.

For census purposes a farm is defined as a holding on which agricultural operations are carried out and which is three acres or more in size, or from one to three acres in size, and with an agricultural production in 1955 valued at \$250 or more. The holding may consist of a single tract of land or of a number of separate tracts held under the same or different tenures, and operated as a single unit. Where the farm was made up of several parts located in different municipalities, the 1956 Census reported the complete farm as one unit in the municipality where the headquarters was located. The same definition was used in the 1951 Census.

Farms Classified by Tenure and Condition.—Brief statistical information on the tenure and condition of occupied farm land as recorded at the 1951 and 1956 Censuses

* Prepared in the Agriculture Section of the Census Division, Dominion Bureau of Statistics.

is given at pp. 455-456 of the 1957-58 Year Book. Figures showing the farm land in each province under crop, improved pasture, summer fallow, woodland and other condition as at June 1, 1956 are given in the land classification table on p. 20 of this volume.

Number of Farms.—The number of farms in Canada at June 1, 1956, was 575,015, a decrease of 48,076 from the 623,091 farms recorded in the 1951 Census. As compared with 1951, all the provinces showed decreases in number of farms ranging from 5.8 p.c. in Alberta to 34.2 p.c. in Newfoundland.

47.—Number of Farms, by Province, Censuses of 1951 and 1956

Province or Territory	1951	1956	Percentage Change 1951-56
	No.	No.	
Newfoundland.....	3,626	2,387	-34.2
Prince Edward Island.....	10,137	9,432	-7.0

Farm Machinery.—The upward trend in the number of machines on farms in Canada continued through the 1951-56 period. For Canada as a whole, all types of machines included in the 1956 Census showed an increase in number and in farms reporting them.

¹ Includes the Yukon and Northwest Territories.

Farm Electrification.—Nearly three-quarters of the farms in Canada reported electric power in 1956. Provinces were divided into two distinct groups—above and below the national average of 73.5 p.c. In the first group were Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba and British Columbia, in which the percentage of farms reporting electric power ranged from 81.9 p.c. in British Columbia to 89.1 p.c. in Ontario. The second group included Newfoundland, Prince Edward Island, Saskatchewan and Alberta where the percentages ranged from 39.7 p.c. in Prince Edward Island to 51.5 p.c. in Alberta.

Section 6.—International Crop Statistics

Tables 51 and 52 are based on estimates published on Jan. 11, 1960 and Feb. 12, 1960 by the Foreign Agricultural Service, United States Department of Agriculture, and give the acreages and production of wheat and the production of oats and barley for the harvests of 1957 and 1958, with averages for the years 1950-54, in the leading countries of the world.

51.—Estimated Acreages and Production of Wheat Harvested in 1957 and 1958 in Specified Countries, with Average for 1950-54

NOTE.—Many of the averages and the figures for 1957 have been revised since the publication of the 1959 Year Book.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Canada's extensive forests have been an invaluable asset to the country and its people since the earliest days of settlement. The productive portion of these forests has poured increasing wealth into the stream of national income, contributing to the economy of the country as the producer of raw materials for industry and as the source of livelihood for hundreds of thousands of persons. At the same time, the existence of widespread forest cover, productive or unproductive in the sense of human utilization, remains essential to the maintenance of the balance of nature—in protecting water-catchment areas and assuring supplies of water, in lowering the temperature, reducing the velocity of the wind and protecting the land against drought and erosion, and in providing shelter for birds and animals.

Section 1.—Forest Regions†

The forests of Canada cover a vast area in the north temperate climatic zone. Wide variations in physiographic, soil and climatic conditions cause marked differences in the character of the forests in different parts of the country; hence eight fairly well defined forest regions may be recognized. These regions, with the relative proportion of the total area of all forest regions occupied by each, are as follows:—

Region	Percentage of Forested Area	Region	Percentage of Forested Area
Boreal.....	82.1	Acadian.....	2.0
Great Lakes-St. Lawrence.....	6.5	Columbia.....	0.8
Subalpine.....	3.7	Deciduous.....	0.4
Montane.....	2.3		
Coast.....	2.2	TOTAL.....	100.0

* Sections of this Chapter that deal with forestry and the federal forestry program were revised in the Forestry Branch, Department of Northern Affairs and National Resources, Ottawa. Provincial forestry programs were prepared by the forestry officials of the respective provincial governments. Sections dealing with forest and allied industries, except as otherwise noted, have been revised in the Forestry Section, Industry and Merchandising Division, Dominion Bureau of Statistics.

† A more detailed discussion of forest regions is given in Bulletin 123, *Forest Regions of Canada*, published by the Forestry Branch of the Department of Northern Affairs and National Resources. Accounts of variations in Canadian physiography and climate are included in a special article on The Climate of Canada, appearing at pp. 23-51 of the 1959 Canada Year Book.

Boreal Forest Region.—This region comprises the greater part of the forested area of Canada, forming a continuous belt from Newfoundland and the Labrador Coast westward to the Rocky Mountains and northwestward to Alaska. The white and the black spruces are characteristic species; other prominent conifers are tamarack which ranges throughout, balsam fir and jack pine in the eastern and central portions, and alpine fir and lodgepole pine in the western and northwestern parts. Although the forests are primarily coniferous, there is a general admixture of broadleaved trees such as the white birches and poplars; these play an important part in the central and south-central portions, particularly in the zone of transition to the prairie. In turn, the proportion of spruce and tamarack rises northward, and with increasingly rigorous climatic conditions the close forest gives way to the open lichen-woodland which finally merges into tundra. In the east there is, along the southern border of the Region, a considerable intermixture of species from the Great Lakes-St. Lawrence Forest such as the white and the red pines, yellow birch, sugar maple, black ash, and eastern white cedar.

Subalpine Forest Region.—This is a coniferous forest found on the mountain uplands in Western Canada. It extends northward to the major divide separating the drainage of the Skeena, Nass and Peace Rivers on the south and to that of the Stikine and Liard Rivers on the north. The characteristic species are Engelmann spruce, alpine fir, and lodgepole pine. There is a close relationship with the Boreal Region, from which the black and the white spruces and aspen intrude. There is also some entry of blue Douglas⁺ fir from the Montane Forest, and of western hemlock, western red cedar, and amabilis fir from the Coast Forest. Other species found are western larch, whitebark pine, and limber pine, and on the coastal mountains yellow cedar and mountain hemlock.

Montane Forest Region.—This Region occupies a large part of the interior uplands of British Columbia, as well as a part of the Kootenay Valley and a small area on the east side of the Rocky Mountains. It is a northern extension of the typical forest of much of the western mountain system in the United States, and comes in contact with the Coast, Columbia and Subalpine Forests. Ponderosa pine is a characteristic species of the southern portions. Blue Douglas fir is found throughout, but more particularly in the central and southern parts; lodgepole pine and aspen are generally present, the latter being particularly well represented in the north-central portions. Engelmann spruce and alpine fir from the Subalpine Region become important constituents in the northern parts, together with white birch. The white spruce, though primarily Boreal in affinity, is also present here. Extensive prairie communities of bunch-grasses and forbs are found in many of the river valleys.

Coast Forest Region.—This is part of the Pacific Coast Forest of North America. Essentially coniferous, it consists principally of western red cedar and western hemlock, with abundant Sitka spruce in the north, and with the addition of Douglas fir in the south. Amabilis fir and yellow cedar occur widely and, together with mountain hemlock and alpine fir, are common towards the timberline. Western white pine is found in the southern parts and western yew is scattered throughout. Broadleaved trees, such as black cottonwood, red alder and broadleaf maple, have a limited distribution in this Region. Arbutus and Garry oak occur in Canada only on the southeast coast of Vancouver Island and the adjacent islands and mainland. These are species whose centres of population lie to the south in the United States.

Columbia Forest Region.—A large part of the Kootenay River Valley, the upper valleys of the Thompson and Fraser Rivers, and the Quesnel Lake area of British Columbia contain a coniferous forest closely resembling that of the Coast Region. Western red

cedar and western hemlock are the characteristic species in this interior "wet belt". Associated trees are the blue Douglas fir, which is of general distribution, and, in the southern parts, western white pine, western larch, grand fir and western yew. Engelmann spruce from the Subalpine Region is important in the upper Fraser Valley and is found to some extent at the upper levels of the forest in the remainder of the Region. At lower elevations in the west and in parts of the Kootenay Valley the forest grades into the Montane Region and, in a few places, into prairie grasslands.

Deciduous Forest Region.—A small portion of the deciduous forest, widespread in the eastern United States, occurs in southwestern Ontario between Lakes Huron, Erie and Ontario. Here, with the broadleaved trees common to the Great Lakes-St. Lawrence Region, such as sugar maple, beech, white elm, basswood, red ash, white oak and butternut, are scattered a number of other broadleaved species which have their northern limits in this locality. Among these are the tulip-tree, cucumber-tree, papaw, red mulberry, Kentucky coffee-tree, redbud, black gum, blue ash, sassafras, mockernut and pignut hickories, and scarlet, black and pin oaks. In addition, black walnut, sycamore and swamp white oak are largely confined to this Region. Conifers are few, and there is only a scattered distribution of white pine, tamarack, red juniper and hemlock.

Great Lakes-St. Lawrence Forest Region.—Along the Great Lakes and the St. Lawrence River valley lies a forest of a very mixed nature, characterized by the white and the red pines, eastern hemlock and yellow birch. With these are associated certain dominant broadleaved species common to the Deciduous Forest Region, such as sugar maple, red maple, red oak, basswood and white elm. Other species with wide range are the eastern white cedar and large-tooth aspen and, to a lesser extent, beech, white oak, butternut and white ash. Boreal species, such as the white and the black spruces, balsam fir, jack pine, poplars and white birch, are intermixed and, in certain central portions as well as in the east, red spruce becomes abundant.

Acadian Forest Region.—Over the greater part of the Maritime Provinces, exclusive of Newfoundland, there is a forest closely related to the Great Lakes-St. Lawrence Region and, to a lesser extent, to the Boreal Region. Red spruce is a characteristic though not exclusive species, and associated with it are balsam fir, yellow birch and sugar maple, with some red pine, white pine and hemlock. Beech was formerly a more important forest constituent than at present, for the beech bark disease has drastically reduced its abundance in Nova Scotia, Prince Edward Island and southern New Brunswick. Other species of wide distribution are the black and the white spruces, red oak, white elm, black ash, red maple, white birch, wire birch and the poplars. Eastern white cedar, though present in New Brunswick, is extremely rare elsewhere, and jack pine is apparently absent from the upper St. John Valley and the western half of Nova Scotia.

Section 2.—Forest Resources

The forested area of Canada is estimated at 1,707,638 sq. miles, and about 56 p.c. of that area is capable of producing merchantable timber. Of this productive area, 714,938 sq. miles are now accessible for commercial operations and the remainder, at present beyond the reach of economical transportation facilities, contains much valuable timber that will be brought progressively into commercial development as demand requires its use and as transportation becomes available. The great areas of forest considered commercially non-productive are nevertheless of significant value to the country in

the influence they exert on climate, moisture and soil. The total forested area of Canada, classified by type of growth and by province, is given in Table 1, p. 20.

There are more than 150 tree species in Canada, of which 31 are conifers, commonly called 'softwoods'. About two-thirds of these softwoods and 10 p.c. of the large number of deciduous or 'hardwood' species are of commercial importance. Approximately 82 p.c. of the volume of merchantable timber is made up of softwood species. The dominant species existing in each forest region are given in Section 1. Detailed information is contained in Forestry Branch Bulletin No. 61, *Native Trees of Canada*,* published by the Department of Northern Affairs and National Resources.

The predominant part played by the lumber and other forest products industries in the development of Canada has resulted in a widespread tendency to evaluate the forests in terms of timber alone. A growing realization of the economic importance of the non-timber values, however, is bringing about increasing recognition of the true value of the forests and is thus developing a broader concept of forestry.

* Obtainable from the Queen's Printer, Ottawa, price \$1.50.

¹ Ten inches D.B.H. and over (suitable for saw timber).

² Four to nine inches D.B.H. (units of 85 cu.

feet).

³ Excludes the volumes on 86,387 sq. miles in Newfoundland and Quebec.

Tenure of Forest Land.—Corporations and private individuals own 9 p.c. of the productive forest land of Canada and 91 p.c. is in the possession of the Crown in the right of the federal or the provincial governments. Rights to cut Crown timber under lease or licence have been granted on 21 p.c. of the productive forest land; the remainder comprises unalienated productive forest areas and small areas of logged lands that have reverted to the Crown.

Woodlots on the 575,000 farms across Canada comprise about 4 p.c. of the total accessible productive forest. These small wooded tracts ranging in size from three or four acres to 200 or more acres are among the most accessible forests in Canada. Further, the woodlots of Eastern Canada are, in general, highly productive because they lie in the southern parts of the country and frequently occupy soils that are considerably higher in quality than those typical of the northern forests.

Section 3.—Forest Depletion

General information on forest depletion and increment as well as statistics on forest fires and fire losses are presented in this Section. The scientific control of the influences that account for wastage, such as forest fires, insect pests, etc., is dealt with in Section 4.

The average annual rate and cause of depletion of reserves of merchantable timber during the ten years 1948-57, together with annual data for 1957 and 1958, are given in Table 3. Of the total depletion of the forests in the ten-year period, 92 p.c. was utilized and 8 p.c. was destroyed by fire. (Information on the extent of damage caused by agencies other than fire, such as insects, disease and natural mortality, is not available.) The average annual utilization of 3,164,329,000 cu. feet comprised 47 p.c. logs and bolts, 40 p.c. pulpwood, 11 p.c. fuelwood, and about 2 p.c. miscellaneous products. About 6 p.c. of the total utilization was exported in the form of logs and bolts and pulpwood.

The accessible portion of the productive forests of Canada, covering an area of 714,938 sq. miles, constitutes the reserve from which forest production will be obtained for many years to come. The supply of merchantable timber on this area is estimated at 589,107,000,000 cu. feet and the utilization in 1958 of 3,049,050,000 cu. feet therefore represented 0.5 p.c. of the accessible productive volume. However, it should be noted that utilization does not occur evenly throughout the accessible productive forest area but is concentrated on the relatively small area of occupied forest land (land under lease, licence or private ownership). Thus overcutting may occur on many of these occupied areas, emphasizing the need for orderly management of all commercial forests if the forest industries are to maintain a dominant position in the Canadian economy.

The more efficient utilization of cut timber is an important factor related to forest depletion, for there is little doubt that in the past too high a percentage of the sawn log was discarded. However, changes of great significance have taken place recently in the uses of wood, permitting the utilization of sizes, qualities and species previously considered unmerchantable. The development and manufacture of rayon, cellophane and other products of the cellulose industry have extended the use of wood and the increasing production of plastic-wood products, fibre board and laminated wood has resulted in greater use of inferior grades of wood and species of trees and therefore in the more complete utilization of forest resources and the elimination of much waste.

¹ Including logs for pulping.

² The figure for depletion does not include wastage by agencies other than fire, such as insects, diseases and natural mortality, for which no reliable estimates are available. It represents an average annual depletion of 7 cu. feet per acre on the accessible productive forest area; a much higher rate of depletion occurs on the more accessible occupied productive forest lands.

Forest Fire Statistics.—Forest fires in Canada during 1958 numbered 7,817, as compared with 6,080 during 1957 and an annual average of 5,586 for the 1948-57 period. The area burned in 1958 was 4,939,880 acres, more than double the annual average for the decade. Both value of timber destroyed and cost of fire suppression reached all-time highs. Much of the loss was attributable to exceptionally dry weather during the summer in British Columbia, Alberta and the Yukon, and lightning was responsible for more fires than any other single cause. The percentage of fires caused by lightning increased from 14 in 1957 to 21 in 1958; the percentage of railway-caused fires also increased over 1957 but all other causes either declined or remained the same, on a percentage basis. More than 3,000 additional square miles of forest area were placed under protection during the year.

Section 4.—Forest Administration, Research and Conservation**Subsection 1.—Federal Forestry Program**

Administration.—The Federal Government is responsible for the protection and administration of the forest resources of the Yukon and Northwest Territories and of other federal lands such as the National Parks, forest experiment stations, military areas and Indian reserves. The Federal Government also administers the Canada Forestry Act which provides, among other things, authority for the operation of forest experiment stations and forest products laboratories.

The Act also authorizes the granting of federal assistance to the provinces to enable them to improve the management of their own forests. Under the Federal-Provincial Agreements signed under authority of the Act, seven of Canada's ten provinces have undertaken a forest inventory with federal financial assistance, and six provinces have reforestation agreements. The history of the Federal-Provincial Agreements and their relation to the Canada Forestry Act is described in a special article appearing in the 1956 Year Book, pp. 459-466. In 1957 the Federal Government broadened the implementation of the Canada Forestry Act by providing financial assistance to the provinces for forest fire protection. A total of \$5,000,000, available over a five-year period, may be applied to capital expenditures, such as the cost of fire protection equipment and improvements, and of forest access roads, trails and buildings required for forest fire protection.

The Forestry Branch of the Department of Northern Affairs and National Resources has been continuing work on the aerial forest mapping of federally administered lands and other territories. For example, forest inventory maps have been prepared from air photographs for portions of the Yukon and Northwest Territories and data have been collected on the ground to support the interpretation of the photographs. The development of instrumental aids in forest photography and in interpretation is being continued by this Branch.

Forestry Research.—In the field of forestry the chief responsibility of the Federal Government is to carry out research in problems affecting the forests of Canada and their development, conservation and more effective utilization. To this end, forest research and forest products research facilities have been expanded greatly throughout the country during the past five years. The Forestry Branch of the Department of Northern Affairs and National Resources conducts research in forest economics, silviculture, forest management, forest ecology, tree physiology, tree breeding, forest soils, forest inventory methods,

forest fire protection, and in forest products. An extensive program of research is under way on the forest experiment stations and on other lands, where an increasing proportion of the research in silviculture and forest management is done in co-operation with provincial forest services and wood-using industries.

Research in the economics of forestry provides the basis for intelligent decisions on the economic aspects of managing forest lands and of utilizing their products and services. It embraces the whole range of economic activities that relate to the use of forest resources, including the fields of consumption, distribution and processing of the products of the forest.

Research in silviculture and management is concentrated mainly in (a) assessing the factors responsible for success or failure in securing natural regeneration following practical cutting methods and different treatments of seed beds, (b) comparing different methods of seeding and planting, and (c) determining the effects of different methods of harvest cutting on the development of residual trees and stands. Studies are made of growth and yield and of successional changes in most of the important forest types. Techniques used in mensuration are constantly under review and study; new methods are tested and developed. Application of silvicultural techniques as well as research in regulation of cut and in methods of protection are aimed at determining how forests may be maintained at the highest levels of production. The relationships between forest growth and site are being studied with a view to the assessment of long-term productivity. The requirements of light and temperature that will produce optimum conditions for growth and development are being determined for the seedlings of many important species of trees. The physiological processes of growth and reproduction are under investigation in a limited number of species. The tree breeding program comprises selecting and developing superior strains and improving techniques for propagating new strains through artificial or controlled pollination. Research in forest soils is directed toward determining the relation of tree growth and nutrition to chemical and physical properties of the soil.

Forest fire protection is a vital problem and is therefore a major concern of federal authorities. In forest fire research the federal Forestry Branch is working toward full co-operation with the provincial forest services in achieving the best methods of forest fire protection. The leading contributions of the Branch have been in the field of fire danger measurement and in the development of equipment and techniques for fire fighting. The more important studies being undertaken at present include development of methods and techniques for classifying fuel types and mapping them, development of methods of rating the severity of fire seasons and of determining the efficiency of fire-protection associations and testing of equipment, such as back-pack tanks and hose, used in fire suppression.

Research in forest inventory methods is of increasing importance because of greatly expanded programs of forest inventories being conducted in most provinces and in the northern territories. Data from air photographs are correlated with field work to develop new techniques of timber estimating, which is being facilitated by the use of stand volume tables. Various methods of field sampling are being investigated and compared. Research is continuing in methods for measuring tree images and tree shadows to determine heights, crown widths, canopy density and other data from photographs taken in different seasons of the year under various conditions. The use of large-scale photography of sample areas is also being investigated and studies are being made in the identification of species and sub-types. Construction of suitable photogrammetric and other scientific apparatus includes equipment required by the forestry tricamera method of air photography which has been developed to provide maximum forestry information at minimum cost, and the shadow height calculator which facilitates the determination of tree heights from shadows in air photographs.

Forest Products Research.—The Forest Products Laboratories of Canada, a Division of the Forestry Branch of the Department of Northern Affairs and National Resources, conducts forest products research in its laboratories at Ottawa and Vancouver. This research is aimed at supplying the basic and practical knowledge required for the best possible utilization of Canada's forest resources and the provision of goods of satisfactory quality to the ultimate consumers. Research includes the determination of the physical, mechanical and chemical properties of wood and their relation to adaptability in use; studies of the factors affecting the quality of wood and of manufactured wood products; determination of the factors that cause wood waste in logging and manufacturing; research and investigation on the preservative treatment and painting of wood and on the use of wood for the manufacture of cellulose, wallboards, alcohols, organic acids, and extractives; studies to determine possible new economic and more valuable uses for woods; and research aimed at determining methods and means for the practical and economical utilization of all wood substance available from the annual timber harvest. Additional work includes the application of laboratory findings to the standardization of lumber grades, development and improvement of engineering designs in wood, and the development of timber specifications for building codes of Canada. By means of numerous technical publications and through other channels, continuous effort is devoted to the widespread dissemination of research results. To assure that research programs are kept abreast of industrial requirements, the Forest Products Laboratories maintain close co-operation with similar organizations in other countries, as well as with the provinces and the forest-based industries generally.

Pulp and Paper Research.—The Pulp and Paper Research Institute of Canada is a corporation supported jointly by the Canadian pulp and paper industry, the Federal Government and McGill University. In its laboratories at Pointe Claire, Que., which were provided by the Federal Government, research is carried out in the whole broad field of pulp and paper processing, from the growth and harvesting of the forests through the various chemical and mechanical manufacturing processes to the properties of end-products, including the improved utilization of both liquid and solid wastes. Further details are given at pp. 523-525.

Forest Biology.—Research on forest insects and diseases is carried out by the Research Branch of the Department of Agriculture which maintains regional laboratories and field stations in all principal forested regions of Canada. The forest insect and disease survey is a Canada-wide project conducted by the Branch in co-operation with the provincial forest services and forest industries, the primary objective of which is to maintain an annual census of forest insect and disease conditions, and to detect and predict the occurrence of outbreaks. Results of the survey are made immediately available to the owners and operators of forest lands for use in planning salvage programs and directing control operations or other measures to reduce damage. An important secondary objective of the survey is extension of knowledge of the insects and fungi affecting forest trees, including their life histories, ranges of distribution and host-parasite relationships.

The research programs of the regional laboratories are designed to lead to comprehensive understanding of the biology and ecology of the more destructive forest insects and fungi, and the causes of fluctuations in abundance or severity of damage in time and place. Problems under intensive study include insect defoliators, leaf diseases, sucking insects, stem cankers, bark- and wood-boring beetles, trunk and root decays, tip- and root-boring insects, and diseases of tree seedlings in forest nurseries. A recent development is the initiation of investigations of virus diseases of forest trees. Laboratory research on development, physiology, nutrition and taxonomy complements the field ecological studies of insects and fungi in the forest environment. Problems of broad national importance in insect pathology, cytology and genetics, bioclimatology and chemical control are investigated by Branch sections which are appropriately staffed and equipped for research in these special fields.

The Research Branch also carries out experiments in control, utilizing cultural techniques, chemicals and biological control agents including parasites, predators and insect pathogens. Technical advisory services are provided in evaluating possibilities of eradication or control, or other applications of research results. Recent examples include recommendations for reduction of seedling losses in forest tree nurseries through cultural techniques and chemical applications; the co-operative organization of cull surveys to improve forest inventories; consultation with local authorities on the Dutch elm disease problem in New Brunswick, Quebec and Ontario, designed to limit spread and damage through control of the disease vectors and sanitation procedures; and technical co-operation with provincial governments and industrial agencies in the organization of spraying operations against the spruce budworm in New Brunswick and Quebec, and the black-headed budworm and ambrosia beetles in British Columbia.

Subsection 2.—Provincial Forestry Programs

All forested land in provincial territory, with the exception of the minor portions in National Parks, forest experiment stations, military areas and Indian reserves (see Table 2, p. 21), is administered by the respective provincial governments. The forestry program of each province is outlined below.

Newfoundland.—Geographically, the Province of Newfoundland has two separate regions—the Island and Labrador on the mainland. The productive forested land of the Island is estimated at 12,758 sq. miles and of Labrador at 17,747 sq. miles, a total of 30,505 sq. miles. Only 578 sq. miles are classified as farm woodlots. Most of Labrador's forests are leased but are as yet virtually untouched.

A large part of the forest land in the interior of the Island is leased, licensed or owned by paper companies, but a three-mile-wide belt along most of the coastline is retained as unoccupied Crown land for the purpose of providing firewood, construction material, fencing material, etc., for the local population. Within this coastal forest belt every household has legal right to cut 2,000 cu. feet of wood a year for domestic use. This form of cutting is generally without any control or restriction but a policy is being introduced whereby cutting in certain 'management areas' is controlled by forest officers.

Commercial timber-cutting on unoccupied Crown lands has been by permit since 1952; permits for amounts up to 120 cords per person are issued by the field staff but permits for larger quantities must be approved by the government. The number of large permits varies from 10 to 25 each year and usually cover stands damaged by wind, fire or insects. Unoccupied Crown land is divided into 21 Forest Inspector Districts averaging 281 sq. miles in size. The Island is also divided into three Forest Regions, each with a Supervisor who is in charge of Inspectors and is responsible to the Deputy Minister of Resources.

The lack of roads into the remote forests makes fire prevention difficult. Twenty-three well-equipped forest fire depots with radiotelephones are scattered along the coast, and 14 lookout towers, also equipped with radiotelephones, cover a large portion of the forested area. One aircraft, equipped with water-dropping tanks, is stationed at Gander throughout the fire season; it patrols isolated forests and transports fire fighting equipment and crews when necessary. A helicopter is also used at times for this purpose. The forest fire staff, including permanent Inspectors, is approximately 110. The two paper companies maintain their own fire protection organizations.

Forest research for Newfoundland is performed by the Forestry Branch of the federal Department of Northern Affairs and National Resources. No reforestation is done in the province.

Prince Edward Island.—The Forestry Division of Prince Edward Island, formed under the Department of Industry and Natural Resources in 1951, became part of the Department of Agriculture in 1955.

Almost all of Prince Edward Island's woodland is privately owned, so that the Forestry Division is concerned mainly with planting, woodlot management and fire protection. A small nursery has been established jointly with the Federal Government to deal with the Island's needs and many people take advantage of seedlings, supplied by this Division at reasonable cost, to re-stock barren areas. The Federal Government pays half the cost of reforesting waste lands.

In proportion to its size, Prince Edward Island exports a great deal of pulpwood. This export, combined with the fuelwood and lumber cut each year, led the Forestry Division to inaugurate a program designed to educate the owner in the proper care and management of his woodlot.

Fire protection does not constitute too great a problem. Wooded areas are scattered in patches throughout the province and, since a network of roads makes all woodlots accessible, equipment can be brought to the scene of a fire quickly and easily.

Research is limited mainly to reforestation problems and these are studied in the provincial nursery.

Nova Scotia.—The area of Nova Scotia, including fresh water, is 21,425 sq. miles, 15,080 sq. miles of which are classed as forested, exclusive of the Cape Breton Highlands National Park and the area northeast of the park. Ninety-seven per cent of the forested land is regarded as productive.

For Canada as a whole, 90 p.c. of the forested land is held by the Crown, but in Nova Scotia only about 22 p.c. is Crown property. These Crown lands are administered by the Department of Lands and Forests through a professional staff of 25 persons. In addition, there are about 15 professional foresters associated with the forest industry in the administration of privately owned lands. The Department of Lands and Forests administers the Small Tree Conservation Act on all lands and is responsible for forest fire suppression on all lands, regardless of land tenure. Forest fire detection is facilitated by 27 observation towers and an aerial patrol service, all integrated with land vehicles and headquarters by radio and telephone communication systems. Well-equipped fire suppression crews and rangers are stationed throughout the province.

The forest industry is of prime importance to the economy of Nova Scotia. There are some 600 sawmills of all sizes, one large newsprint mill and two large pulp mills in operation at present and a new chemical pulp mill is under construction in the Port Hawkesbury-Mulgrave area. These mills, along with the pulpwood export trade, pitprop production, boxwood and barrel production, as well as other facets, use an equivalent of 1,375,000 cords of wood annually.

An active reforestation program has been under way since 1926. Although not as ambitious an undertaking as in some parts of Canada, the program is being expanded in areas where there are less fortunate circumstances relative to natural regeneration. At present there are four producing nurseries with two others under development. Forest management programs include the construction of access roads into Crown land timber areas under the Federal-Provincial Agreement. Timber, pulpwood and Christmas trees are sold through public tender and cutting is under the recommendations of the district foresters of the Department of Lands and Forests. Inventory surveys, regeneration studies, and experimental cuttings are conducted on Crown lands.

Forest research is carried on by Federal Government agencies and the Nova Scotia Research Foundation (see p. 425). Investigations involve stand improvements, cutting methods, and insect and disease activities. Extension projects include an active fire prevention campaign, a motion picture program for schools, distribution of information on forest and wildlife conservation, promotion of the Christmas tree industry, and preparation of articles for general distribution, for newspapers and for magazines.

New Brunswick.—More than 80 p.c. of the area of New Brunswick is classed as productive forest of which the Crown, in right of the province, owns about one-half. About 2 p.c. is owned by the Federal Government and the remainder is privately owned. The report of a provincial forest inventory, part of the national forest inventory, was published in 1958. The productive forest area is estimated at 23,808 sq. miles and the total volume of wood in merchantable sizes at 16,900,000,000 cu. feet; of the latter, coniferous species make up 71 p.c. and deciduous species 29 p.c. The New Brunswick Forest Development Commission in its report submitted in June 1957 indicated that production of forest industries could be doubled in value within two decades and recommended sweeping changes in provincial government policy.

Protection from forest fires, the first requirement for forest conservation, is mainly the responsibility of the Forest Service which also carries out duties in connection with game protection, colonization and the administration of provincial Crown lands. A large-scale aerial spraying program to protect balsam fir and spruce from the spruce budworm has been carried on since 1952 by a Crown company sponsored by the federal and provincial governments and representatives of the forest products industries.

Timber licences issued by the province authorize operators to cut and remove forest products in accordance with forest management plans and cutting permits. Stumpage dues are paid to the province when products are cut by the licensees.

New Brunswick does not maintain a provincial forest research organization. There is, however, extensive co-operation between the province and the federal Forestry Branch in conducting forest research. The University of New Brunswick also has undertaken a small number of forest research projects in co-operation with the National Research Council, the provincial government, and other interested institutions.

Quebec.—The forested lands of the Province of Quebec cover an area of 378,013 sq. miles extending from its southern borders to latitude 52° north, between the frontier of Labrador in the east, and the Eastmain River Basin in the west. Of this total, 84,088 sq. miles are classed as occupied productive forest land, 21,841 sq. miles of it privately owned, 227 sq. miles federal Crown forests and the remainder provincial Crown land on which leases and permits have been granted. Thus, approximately 293,925 sq. miles of the forested lands of Quebec are inaccessible or vacant. About two-fifths of the annual cut in the forests of Quebec comes from privately owned lands.

The limits reserved for forest industries are administered by the Department of Lands and Forests and the technical work such as inventory, reforestation, superintendence of cutting, control of culling, verification of plans for development, collection of stumpage dues, etc., is the responsibility of the Forest Service. These limits are either leased by auction after public notice has been given or assigned under a special law. The price of the licence is fixed by auction or by Order in Council subsequent to specific legislation. The government reserves the right to dispose of the water powers situated on the limits leased.

A tree-felling permit, which is valid for one year, is renewable if the holder has complied with the conditions imposed; it may be transferred with the authorization of the Minister of Lands and Forests. The lessee of a limit must pay a ground rent in addition to the price of licence and must forward, three months before the cutting begins, a plan of the operations. Wood cut must be measured by a licensed culler and at the end of the operations the limit-holder must produce a sworn statement of quantities cut.

The Forest Service endeavours to promote the use of silvicultural methods among the owners of farm woodlots and small forest areas.

Quebec's forest protective system comprises three organizations: the Protective Service, the protective associations and the non-affiliated lease holders or owners. The Protective Service is a government body established within the Department of Lands and Forests in 1924 to enforce legislation and regulations governing forest fire protection and to protect vacant Crown lands, township reserves and colonization territories. The

protective associations, of which there are six, are syndicates of lease holders and owners who have availed themselves of their right to form an association to satisfy the law which compels them to protect their limits or private forests of 2,000 acres or over. Members assume operating expenses in proportion to the area owned by each but the Department assumes half the costs of fire fighting incurred by the associations. The third group is composed of lease holders and of owners who prefer to discharge their obligations personally as far as forest protection is concerned. They enjoy the same privileges and their obligations are the same as those imposed upon the associations.

To perpetuate the forestry program of the province, the Department has established a number of nurseries, the first at Berthierville in 1908. This nursery has three sections: one wooded with a variety of valuable species of mature age, one serving agricultural purposes, and another devoted to forestry experiments and the cultivation of trees for reforestation or ornamentation. More recently, the Grandes Piles nursery and the Gaspé nursery were organized and there are also nurseries in the following counties: Abitibi-East, Témiscamingue, Saguenay, Îles de la Madeleine, Rimouski, Roberval, Rivière du Loup, Témiscouata and Chicoutimi. Their object is the preparation of plants for reforestation nearby districts. 'Floating' nurseries, supervised by the engineers of the Forest Extension Bureau and intended especially for growing reforestation plants for private properties, are located at Pont Rouge, Sherbrooke, Scott, St. Hyacinthe, Victoriaville and Mont Joli. The plants are supplied free of charge on request. A dynamic reforestation program is now under way in the province, with an ultimate objective of 10,000,000 plants yearly on private grounds.

The Bureau of Silviculture and Botany and the Forestry Products Laboratory, both subsidized by the Department, are actively engaged in scientific research work in the forestry field. The Bureau studies the possibilities of utilizing spoil-heaps of gold and asbestos mines, tests the fertility of soils in the spruce groves, classifies forests according to type of vegetation, and studies growth and yields of stands in the timber limits by means of permanent research spots. The Forestry Products Laboratory, located at the Duchesnay Forestry Station, examines developments in the field of chemical conversion of wood and in the use of forestry by-products.

Ontario.—The long-range program of the Ontario Department of Lands and Forests reached an important milestone during the year ended Mar. 31, 1959 when the forest resources inventory, a major undertaking begun in 1946, was completed. In addition, 12,500 sq. miles of forest area were photographed again in the first of the annual revisions which will keep the inventory up to date. From now on, the management of forest resources in Ontario will be based on detailed information across extensive areas. This is the necessary foundation for the Department's ultimate object—a continuous balance between forest growth and forest harvest, providing a high yield of forest products in perpetuity.

The steady decrease in forest fire losses since 1955 (when 396,423 acres were burned over) was climaxed in 1959 with the relatively small total of 5,279 acres burned over. This is the lowest loss in three decades and probably the lowest in Ontario's history. Although bad fire years are not necessarily a thing of the past, the improvement in the fire record of the past few years appears to have conformed with advances in fire control methods. Many of these advances have followed from fire fighting tactics and equipment developed by Department personnel.

Another important factor in the reduction of fire losses is the constant crusade of the Department to inform the public of the need for fire precautions and for conservation of natural resources. The continuous publicity campaign includes newspaper and magazine display advertising, radio and television broadcasts, posters, picture books of the comic type for school children, articles and editorial assistance to publishers and broadcasters, poster contests for school children, and lectures and films presented to school and adult groups. It is believed that this publicity may have helped to reduce the number of forest

fires from 1,558 in 1958 to 1,027 in 1959. In these two years, fires caused by lightning increased from 219 to 242 but, despite a heavier traffic of sportsmen and vacationists in forested areas, man-caused fires decreased from 1,339 to 785.

The Department's air fleet includes six *Otters* and 39 *Beavers*, designed and built to meet the requirements for aircraft capable of carrying substantial loads and of alighting on and taking off from small areas. From the air it is possible to spot fires in their early stages and to deliver men and equipment close to the fire line before the fire has had time to spread. Such rapid containment action has been mainly responsible for reducing the fire loss from an average of 75 acres per fire in the 1949-58 decade to an average of five acres per fire in 1959.

After two years of service, the Department's water-dropping equipment has proved its worth and is being duplicated by fire fighting agencies outside the province. The equipment consists of tanks (mounted on aircraft floats) which scoop up water as the aircraft taxis over a lake and then disperse it over the fire in effective wetting action.

To maintain forest yield and to eliminate wasteful cutting practices, cutting plans for Crown lands must be approved by the Department. Mills are limited to a size proportionate to the amount of raw material that will be steadily available. Integrated operations are required to ensure that no useful part of a felled tree is wasted. A telephone pole, a railway tie, pulpwood and other products may all come from the same tree.

At the end of March 1960, Crown forest areas were divided into 125 management units which covered a total area of 210,919 sq. miles. Of these, 48 were under licence to private companies which are held responsible for management plans over an area of 89,754 sq. miles. The 77 Crown units cover 120,165 sq. miles. By the end of the year, 33 of the licensed companies had submitted plans covering 66,043 sq. miles, and 65 Crown units had prepared plans covering 111,669 sq. miles: a total of 98 management plans covering 177,712 sq. miles. Within the Crown management units, 58 licensees (each covering more than 50 sq. miles) were responsible for management plans over 12,111 sq. miles. By the end of the year, 47 licensees had submitted plans covering 9,021 sq. miles.

During the year ended Mar. 31, 1960, 33,414,110 forest trees were supplied by the Department's nurseries, bringing the cumulative total to well over the 500,000,000-mark. During the year, 16,080,698 trees were planted on Crown lands; 12,986,865 were supplied to owners of private lands; and 4,109,640 were planted in forests belonging to municipalities or conservation authorities and managed by the Minister of the Department. These managed forests now have a total area of 135,964 acres.

As new nurseries come into production, the annual rate of reforestation is expected to increase to 60,000,000 trees. In the more distant future, the quality of trees planted is expected to improve considerably as seed orchards make better seed available. In addition, natural forest growth is being encouraged by improvement of the forest seed bed by scarification, by herbicides sprayed from aircraft to free valuable species from the competition of worthless vegetation and, most significantly, by cutting methods to increase the natural seed supply and promote the survival of seedlings. After several years of experimentation, important new hybrid species are being developed. Inoculations of white pine against blister rust have been successful. Of several pieces of equipment developed by the Mechanical Research Section, special interest was shown in a dusting machine which can be operated in thick bush terrain. Potentially important work is being done in many areas of forestry research conducted at Maple, Port Arthur, Cochrane, Tweed and Dorset.

Manitoba.—The forests of Manitoba are administered by the Forest Service, a Branch of the Department of Mines and Natural Resources. The Service is headed by a Provincial Forester and the province is divided into four Forest Districts—Northern, Southern, Eastern, and Western—each with a District Forester in charge. The Whiteshell

Forest Reserve, which is an important recreational area, is also supervised by a Forester. Each Forest District is subdivided into Forest Ranger Districts of which there are 40, each in charge of a Forest Ranger.

The cutting of mature timber is governed by timber sale, licensed timber berth, pulpwood lease, or timber permit. Timber sales are disposed of by public auction and cover periods of from one to seven years; timber berths cover certain areas granted before 1930, the date of the transfer of the natural resources from the Federal Government to the province; pulpwood leases are granted over an area of 2,748 sq. miles; and timber permits are granted to settlers and small operators at appraised rates for a period of one year or less.

An inventory of the forest resources of the province was completed in 1956 as part of the conservation plan. On the basis of this inventory and other information, working plans with annual allowable cuts on a sustained-yield basis have been brought into operation in the more accessible areas.

Fire protection, also part of the conservation plan, is one of the most important activities of the Forest Service. Fires are detected by air patrol, lookout tower and road patrol and rapid communication is maintained within the Service by radio and telephone. The Air Service transports men and equipment to fires in areas beyond the reach of roads. The main air base is at Lac du Bonnet and summer air bases are maintained at The Pas, Norway House and Thicket Portage. The total area under fire protection is about 97,000 sq. miles.

Regeneration of the forest is mainly dependent on natural means although 4,000,000 trees were planted during the past five years as part of the Federal-Provincial Agreement (see p. 513). The Pineland Forest Nursery is operated at a point near Hadashville to supply planting stock for denuded areas of Crown land and to furnish farmers with shelter-belt and woodlot seedlings.

The province has no forestry research organization but co-operates with several federal services which maintain two research areas.

The Conservation Branch of the Department of Mines and Natural Resources distributes information on all aspects of the Department's resource management programs. A large part of the Branch work, particularly during the summer, is devoted to publicizing the activities of the provincial forest management program. Film and lecture tours are conducted, pamphlets distributed and training and assistance for field staff provided, all with the objective of making the public aware of the great value of the provincial forests and of the need for their wise use and protection.

The Department of Mines and Natural Resources co-operates fully with federal authorities in investigating and controlling forest damage resulting from insects and diseases.

Saskatchewan.—The forests of Saskatchewan, including watered areas, are located mainly in the northern half of the province and cover 147,360 sq. miles or 58 p.c. of the total area of Saskatchewan. Provincial forests constitute approximately 92 p.c. of all forest land in the province and are managed and developed by the Forestry Branch of the Department of Natural Resources.

The Forestry Branch, consisting of six divisions—Administration, Fire Control, Forest Management, Forest Research, Inventory, and Silviculture—is responsible for developing and evaluating forest policies and management programs based on the findings of inventory and research. The responsibility for carrying out such policies and programs is borne by the Regional Administration Branch. For purposes of resource administration the province is divided into five regions—each of which is under the supervision of a regional superintendent. The regions are broken down into conservation officer districts which vary in size according to the resource base and the population to be served. Close liaison is maintained between the Forestry Branch and the Regional Administration Branch.

A major responsibility of the Forestry Branch is the development of techniques in the prevention, detection and suppression of forest fires. A network of 85 lookout towers equipped with two-way radios is maintained throughout the province and supplemented by six aircraft on regular patrol during the high-hazard periods. In 1959 a helicopter was used for the first time on fire detection and suppression work. A group of smoke-jumpers, originally organized in 1947, has been trained to parachute on remote fires. This unit is in constant readiness during the fire season and takes immediate suppression action which is maintained until the smoke-jumpers are relieved by overland crews.

Northern Saskatchewan's communication system, with over 800 radio sets in operation in towers, vehicles, aircraft and woods camps, plays a vital role in the detection and suppression of forest fires. These activities have also been assisted in recent years by the construction of over 2,000 miles of forest access roads.

Alberta.—The 158,529 sq. miles of provincial forest in Alberta are administered by the Forests Division of the Department of Lands and Forests at Edmonton. The Division is composed of five forestry branches under a Director of Forestry: Administration, Forest Protection, Forest Management, Forest Surveys, and Radio.

The Administration Branch supervises all branches, maintaining general control over revenue and expenditure, deals with personnel and conducts a Forestry Training School which offers in-service training for forest officers and other employees.

Protection of the forests is in the charge of the Forest Protection Branch and all field personnel. For ease of administration the forested area has been divided into seven Divisions, each responsible for the forest within its boundary. These Divisions are composed of Ranger Districts in which all activities are supervised by the district forest officer responsible to his divisional superintendent. The divisional staffs include: Forest Superintendent, Assistant Forest Superintendent, Divisional Forester, Chief Ranger, Mechanical Foreman, Chief Check Scaler, Assistant Check Scaler, Divisional Clerk, Assistant Clerk, Radio Operator, Stenographer and seasonal help such as standby fire crews, forest lookout men and general labourers and construction crews. These employees are responsible for fire prevention, detection and suppression and the supervision of logging and milling operations, timber cruising, and construction and maintenance of forestry projects.

The functions of the Forest Management Branch include the approval and acceptance of management and annual operating plans prepared for other Crown lands, proper land use, proper disposal of Crown timber and the direction of field officers in the administration of all contracts related thereto. This extends to all phases, including acceptance of applications, cruising of timber, drawing up of contracts, periodic inspections of areas to assure proper logging and utilization practices, scaling of products cut, collection of dues and the reforestation of areas denuded through cutting, fire, etc.

The Forest Surveys Branch maintains the provincial forest inventory and prepares and maintains detailed inventories by management units; prepares long- and short-term management and protection plans; provides timber application forest type maps; conducts other work pertaining to photogrammetry and forest cover maps; and provides technical drafting and mapping services to other branches of the Alberta Forest Service and the general public.

Development and maintenance of communications is the function of the Radio Branch. Central stations are maintained at Edmonton and Calgary with smaller stations located at divisional headquarters, lookout towers and ranger districts. A number of portable, mobile and airborne stations combine with the fixed stations to form a flexible and comprehensive communications network for both fire detection and suppression operations.

Conservation of 9,000 sq. miles of forest comprising the Rocky Mountains Forest Reserve is administered by a joint provincial-federal agency—the Eastern Rockies Forest Conservation Board with offices at Calgary. The area is composed of three forests which are subdivided into ranger districts. The Superintendent in charge of each forest is

responsible to the administrative officer in Calgary; his decisions are based on policies formed by the Board which comprises one federal and two provincial members. This Reserve includes the headwaters of the main prairie river system.

Research in general is carried out by the Forestry Branch of the federal Department of Northern Affairs and National Resources (which maintains the Kananaskis Experiment Station) and by the Research Branch of the federal Department of Agriculture.

British Columbia.—The productive forest land of British Columbia in 1958 was inventoried at 208,411 sq. miles and in addition there were 59,227 sq. miles of forest land classed as non-productive. Of the productive area, immature timber occurred on 95,739 sq. miles; 84,275 sq. miles carried matured timber with a total volume of 318,000,000,000 cu. feet; 28,397 sq. miles, including areas of recent burn, cut-over or windfall not yet re-stocked, were unclassified.

For administrative purposes, the province is divided into five Forest Districts with regional headquarters at Vancouver, Prince Rupert, Prince George, Kamloops and Nelson. Further decentralization of authority is effected by subdivision of the Forest Districts into Ranger Districts. There are approximately 25 Ranger Districts in each Forest District. Twelve directional, servicing or policy-forming divisions constitute the head office of the Forest Service at Victoria.

Vigorous efforts are being made to bring British Columbia's forest resources under sustained-yield management and the forest industries are making definite progress toward total utilization of their raw materials. The problem is urgent despite the fact that, with a present annual cut of approximately 1,100,000,000 cu. feet, the total inventory would appear sufficient to support present needs in perpetuity. One of the more spectacular results of sustained-yield administration has been to swing a greater proportion of the annual forest harvest to the interior of the province. For many years, the over-cut coast (wet belt) forests have accounted for from 65 p.c. to 80 p.c. of the total forest cut each year. More recently, however, the interior percentage has risen and in 1959 at least 50 p.c. of the total cut originated there. For all practical purposes, the entire interior forest is publicly owned; the great majority of the privately owned, leased or licensed forests are on the coast.

Several systems of timber disposal are in effect. The most publicized is the Tree Farm Licence which constitutes a contract between the government and a company or individual whereby the latter agrees to manage, protect and harvest an area of forest land for the best possible return, in exchange for the right to the timber crop on the area in perpetuity. Provincial Forests, Public Working Circles, and Sustained Yield Units are the governmental equivalent of the Tree Farm Licence with the timber, when it is ready for cutting, being disposed of by public auction. Management, silviculture, road-building and protection on such areas are the responsibility of the Forest Service. Other tenures of lesser importance are Tree Farms, Farm Woodlot Licences, and Timber Sales.

Protection of the forest, particularly from fire, is still a major problem although the public is becoming more cautious. Improved fire fighting techniques, the use of aircraft for patrol and transportation, employment of helicopters, and a gradually expanding system of lookouts were steadily cutting down fire losses until the disastrous 1958 fire season, which was the worst on record. Close liaison with the Research Branch of the federal Department of Agriculture, which maintains laboratories in Vernon and Victoria provides information about insect and fungal enemies of the forest.

Subsection 3.—The Pulp and Paper Research Institute of Canada *

The Pulp and Paper Research Institute of Canada is a centre of research and learning concerned with virtually every aspect of the production and use of pulp and paper products. It was established in 1913 as a branch of the Dominion Forest Products Laboratories

* Prepared by B. W. Burgess, Secretary, Pulp and Paper Research Institute of Canada, Montreal, Que.

and in 1927 was reorganized under the joint sponsorship of the Canadian Pulp and Paper Association, the Federal Government and McGill University. The Institute staff carries out fundamental research and some applied research in the fields of woodlands operations and pulp and paper mill operations. In addition, in co-operation with McGill University, it trains postgraduate students who are working towards master's and doctorate degrees in physical chemistry, wood chemistry, chemical and mechanical engineering, and whose theses subjects lie in fields of interest to the pulp and paper industry.

The Institute has occupied, since 1927, a building on the McGill campus erected by the pulp and paper industry and in 1958 a new building was completed at Pointe Claire on the western outskirts of Montreal by the Government of Canada in lieu of its former annual financial grants. The building houses Institute staff and facilities formerly located in temporary quarters. The Institute's facilities include: organic and physical chemistry, physics, hydraulics and engineering laboratories; pilot plants for chemical pulping, pulp and chip refining and waste liquor pyrolysis; a greenhouse and other facilities for woodlands research; an extensive library; shops and special facilities for pulp and paper testing and for photographic and microscopic (both light and electron) studies of wood, pulp or paper. At present its staff totals about 150.

The Institute's research activities comprise a basic program, contract research, and technical services. The basic program is supported by assessments from the Maintaining Membership (some 40 companies, representing more than 100 mills and about 90 p.c. of the total production of the Canadian industry) and by a basic grant from the Canadian Pulp and Paper Association. It comprises research of interest to the industry broadly, as distinct from that which is the concern only of a single company or of a small segment of the industry.

The projects in the basic program range from studies of the growing seedling in the forest to the converted pulp and paper product, and fall into six broad classifications: woodlands, mechanical pulping, chemical pulping, paper making, process control and waste utilization. The emphasis is primarily on fundamental and exploratory studies. The Institute is regarded as a centre for broad, long-range and uninterrupted studies of basic principles which individual pulp and paper companies would find difficult to justify in terms of immediate applied objectives. Moreover, the Institute is a centre of highly specialized equipment and manpower which individual companies would not normally have.

In addition to its permanent staff, the Institute, in co-operation with McGill University, has some 25 graduate students working on fundamental projects in the background of pulp and paper technology, which also serve as their theses topics. The head of the Institute's Wood Chemistry Division, who is also the E. B. Eddy Professor of Industrial and Cellulose Chemistry at McGill, directs graduate student work on such subjects as the behaviour of the materials of which wood is made—cellulose, lignin, resins, sugars, and other carbohydrates. The head of the Institute's Physical Chemistry Division, also a Research Associate in the McGill Chemistry Department, directs graduate student work in the physical chemistry of fibres, e.g., the forces which cause cellulose fibres in a water suspension to mat together to form paper. The head of the Institute's Chemical Engineering Division, also Associate Professor of Chemical Engineering at McGill, directs graduate students in such chemical and mechanical studies as the friction losses occurring when pulp flows through pipelines. These Division Heads are assisted by other members of the Institute's staff who likewise hold concurrent honorary positions at McGill.

The Institute also undertakes contract research projects on a cost reimbursement basis for individual companies or groups of companies in the pulp and paper or allied fields. The larger of these co-operative contracts have been concerned with problems of particular segments of the Canadian pulp and paper industry, such as the investigation into the causes of corrosion in alkaline pulping equipment, and the recent study of the rapid deterioration of paper machine wires.

A further function of the Institute is to provide a broad range of technical information services to the industry and, to some extent, to other industries and the public. It maintains a specialized library for this purpose which supplies bibliographies, abstracts, translations, and critical reviews to the scientific staff and the industry.

Section 5.—Forest and Allied Industries

This Section is concerned with the many industries employed in the felling of timber in the forest and its transformation into the numerous utilitarian shapes and forms required in modern living. The basic industries provide the raw material for sawmills, pulp and paper mills and for a wide range of secondary industries that convert the products of the basic industries into more highly manufactured goods such as veneers and plywoods, sash and doors, furniture, and a vast range of industries using wood in any form in their processes. These industries, especially the pulp and paper industry and the lumber industry, contribute substantially to the value of the export trade of Canada and thereby provide the exchange necessary to pay for a large share of the imports purchased from other countries, particularly the United States.

Subsection 1.—Woods Operations

In connection with operations in the woods, the forests provide not only the raw materials for the sawmills, pulp mills, veneer mills, charcoal, excelsior and other plants, but also the logs, pulpwood and bolts for export in the unmanufactured state, and fuel, poles, railway ties, posts and fence rails, mining timber, piling and other primary products that are finished in the woods ready for use or export. A number of minor forest products help swell the total, such as Christmas trees, cascara bark, balsam gum, resin, etc.

Estimates of woods operations attempt to give actual production figures for all items and are based partly on provincial forest service data for volume. Value, as presently estimated, excludes transportation costs, which formed a large part of the consumption values utilized in former calculations.

7.—Value of Woods Operations, by Product, 1953-57

Product	1953	1954	1955	1956	1957

Other products ² \$	8,731,727	2,332,646

¹ In estimating the annual drain on Canada's forest resources, certain converting factors have been used, each of which represents in cubic feet the quantity of merchantable wood used to produce one unit of the material in question. The factor for logs and bolts for the British Columbia coastal region is 175 and for the remainder of Canada 200. Other factors: pulpwood 85, fuelwood and wood for charcoal 80, poles and piling 15, round mining timber 95, hewn railway ties 5, fence posts 1.2 and fence rails 1.

² Converted to rough cords and included with pulpwood.

³ Chiefly Christmas trees but also includes balsam gum, cascara bark, etc.

¹ Includes value of forest products other than wood.

Subsection 2.—The Lumber Industry

The manufacture of sawn lumber is the second most important industry in Canada depending on the forest for its raw materials.

The total number of sawmills, tie, shingle, lath, veneer, stave, heading and hoop mills and mills for cutting-up and barking or rossing of pulpwood, reports of which were compiled for 1958, was 5,769 as compared with 6,276 in 1957. Mills sawing less than 15,000 ft. b.m. are excluded but account for less than one-half of one per cent of the total lumber production. Employees numbered 47,763 and wages and salaries amounted to \$142,700,044. Logs, bolts and other materials and supplies of the industry were valued at \$300,342,531, the gross value of production was \$546,299,359 and net value \$236,752,567.

Lumber production in Canada reached its maximum in 1955 at 7,920,033,000 ft. b.m., decreasing to 7,739,603,000 ft. b.m. in 1956 and 7,099,758,000 ft. b.m. in 1957 and amounting to 7,179,080,000 ft. b.m. in 1958. Value of lumber produced in the years 1955 to 1958 decreased from \$541,563,241 in 1955 to \$459,900,750 in 1958.

Lumber Exports.—Exports of planks, boards and square timber are given in Chapter XXI on Foreign Trade.

Subsection 3.—The Pulp and Paper Industry

The manufacture of pulp and paper has been the leading industry in Canada for many years and the postwar development of the industry has more than kept pace with the vast industrial growth of the nation. Pulp and paper stands first among all industries in net value of shipments, in exports, in total wages paid and in capital invested. It is the largest consumer of electric energy and the largest industrial buyer of goods and services, including transportation, in the land. The industry has a newsprint output about four times that of any other country and provides over 50 p.c. of the world's newsprint needs. Canada is one of the world's greatest woodpulp exporters and stands second only to the United States as a producer of pulp.

There are three classes of mills in the industry. In 1958, 30 were making pulp only, 24 were making paper only and 74 were combined pulp and paper mills.

The industry includes several forms of industrial activity: operations in the woods with pulpwood as a product, the manufacture of pulp and paper of all kinds, and the manufacture of paperboards. Some of the important pulp companies operate sawmills to utilize the larger timber on their limits to the best advantage, and some lumber manufacturers divert a portion of their spruce and balsam logs to pulp mills. Only about 12 p.c. of the pulpwood cut in Canada is exported in raw or unmanufactured form and a large portion of such exports is cut from private lands.

13.—Production, Consumption, Exports and Imports of Pulpwood, 1948-57

NOTE.—Figures in this table are not comparable with those published in the corresponding table of the 1957-58 and previous Year Books.

¹ Given in terms of rough or unpeeled wood.

² Newfoundland included from 1949.

Pulp Production.—The manufacture of pulp, the second stage in this industry, is carried on by mills producing pulp only and also by paper manufacturers operating pulp mills in conjunction with paper mills to provide their own raw material. Such mills usually manufacture a surplus of pulp for sale in Canada or for export. Spruce, supplemented by balsam fir in the east and by hemlock in the west, is the most suitable species for the production of all but the best types of paper.

The preliminary preparation of pulpwood is frequently carried on at the pulp mill but there are also a number of cutting-up and rossing mills operating on an independent basis, chiefly for the purpose of saving freight on material cut at a distance from the mill or on material intended for export. Pulpwood is measured by the cord (4' by 4' by 8' of piled material). One cord of rough pulpwood contains approximately 85 cu. feet of solid wood, and one cord of peeled pulpwood 95 cu. feet.

Of the total 1958 pulp production, 85 p.c. was made in combined pulp and paper mills by companies manufacturing paper. The remainder was made for sale in Canada or for export by mills making pulp only. More than 53 p.c. was groundwood pulp and 15.9 p.c. unbleached sulphite fibre, these being the principal components of newsprint paper. Bleached sulphite, bleached, semi-bleached and unbleached sulphate, soda fibre, semi-chemical, other grades, and groundwood and chemical screenings made up the remainder. A considerable market has developed for screenings in connection with the manufacture of rigid insulating boards.

The manufacture of 10,137,454 tons of pulp produced in 1958 entailed the use of 12,624,165 cords of rough pulpwood valued at \$338,226,407 and the equivalent of 1,243,108 rough cords of other wood (i.e., sawmill chips, slabs and edgings, sawdust, butts, cores, etc.) valued at \$22,300,804. The total value of materials used in the manufacture of pulp was \$436,312,608.

¹ Production figures differ slightly from DBS figures given in Table 14, because of a different basis of calculation.

Paper Production.—During 1958 there were 98 establishments producing paper and paperboard in Canada. In addition to newsprint, Canadian mills have a highly developed production of fine paper, wrapping paper, tissues, paperboard and other cellulose products.

18.—Paper Production, by Type, 1949-58

NOTE.—Figures for earlier years will be found in the corresponding table of previous Year Books.

World Newsprint Statistics.—Since 1913 Canada has led the world in the export of newsprint. Figures for the leading producing countries for the two latest years available are given in Table 21; 1939 figures are included for comparative purposes. The six countries listed accounted for 73 p.c. of the estimated world production in 1958, Canada contributing about 45 p.c.

¹ Figures differ slightly from DBS figures given in Tables 18 and 20, because of different bases of calculation.

Statistics of the Combined Pulp and Paper Industries.*—The manufacture of pulp, the manufacture of paper and the manufacture of products made of paper may, under certain conditions, be treated as three industries for they are frequently carried on in separate plants by entirely independent companies. The manufacture of basic stock and the converting of this paper into stationery and other highly processed paper products are often combined in one plant. This conversion of paper within the pulp and paper industry represents only a small part of Canada's production of converted paper and boards, the bulk of which is still made in special converting mills classified in other industrial groups.

The presence of these different combinations in one mill makes it difficult to separate many of the statistics relating to the manufacture of pulp, basic paper and converted paper products. All converting operations carried on in paper mills in this industry are attributed to the particular industrial group of converting plants to which they properly belong. Including manufacturing operations as far as the basic paper-making stage, there were altogether 128 mills in operation in 1958. The employees numbered 64,084 and their salaries and wages amounted to \$307,415,615, as against \$307,627,849 in the previous year. If the pulp made for their own use in combined pulp and paper mills is disregarded, the total value of materials and supplies used in the industry as a whole amounted to \$597,804,877 in 1958 compared with \$617,175,797 in 1957; the selling value of factory shipments to \$1,394,679,180 in 1958 and \$1,411,934,462 in 1957; and value added by manufacture to \$702,950,789 in 1958 and \$693,475,562 in 1957.

The pulp and paper industry is one of the leading single manufacturing industries in Canada. For a number of years it has been first in selling value of factory shipments, in value added by manufacture, in employment and in salaries and wages paid. The manufacturing stages only of the industry are considered in these comparisons, no allowance being made for capital invested, men employed, wages paid or primary products sold in connection with the woods operations. These form an important part of the industry as a whole but cannot be separated from woods operations carried on in connection with sawmills and other industries. In world trade, pulp and paper are generally Canada's main commodities—newsprint alone, over a considerable period, has brought Canada more export dollars than wheat, nickel or any other single commodity.† The United States market absorbs annually over 80 p.c. of all pulpwood exports and over 80 p.c. of the pulp and the paper shipments of Canada.

Subsection 4.—The Veneer and Plywood Industries‡

The production of hardwood veneer and plywood in Canada is confined largely to the eastern provinces. Changes in manufacturing methods applied to hardwood plywood resulted in its adaptation to many uses, particularly to wall finishes for homes and other buildings.

Softwood veneer and plywood are produced almost entirely in British Columbia. Douglas fir is most commonly utilized because of the availability of large diameter logs of this species from which large sheets of clear veneer can be obtained. The use of synthetic resin adhesives is responsible for this product that has become almost indispensable to the construction industry—for wall panels, concrete forms, roofing, sheeting and house sub-floors; for construction of silos, cribs and caissons; for box-car linings, bus bodies, trailers, power-driven and other types of watercraft; for box panels and crate linings, case goods and core-stock for furniture; for plywood-faced doors and for many other items.

The heating of glued veneers in moulds by high-frequency electric fields (dielectric heating) permits the manufacture of shaped plywood which is now being used for furniture, radio cabinets and similar products.

* See Chapter XIV for further particulars regarding the pulp and paper and paper-converting industries.

† For reasons given in Section 1, Part II of the Foreign Trade Chapter, gold is excluded from Canadian trade statistics.

‡ Prepared by the Forest Products Laboratories, Forestry Branch, Department of Northern Affairs and National Resources, Ottawa.

Veneers of Canadian manufacture are not confined to species native to Canada. A number of imported woods of special decorative value are veneered successfully and provide the furniture industry with a wide choice of finishes. Exports of veneer and plywood produced in Canada increased in value from \$969,256 in 1938 to a high of \$30,103,676 in 1955, but declined to \$22,523,609 in 1958.

Subsection 5.—The Wood-Using Industries

The wood-using group comprises thirteen industries,* other than sawmills and pulp mills, using wood as their principal raw material. Most of these industries obtain from the sawmills the wood they transform into planed and matched lumber, boxes, barrels, furniture, caskets and other manufactured or semi-manufactured products but the veneer and plywood and excelsior industries usually manufacture their products direct from logs and bolts.

This wood-using group does not include every industry into which wood enters as a raw material but only those producing commodities where the chief component is wood. There are a number of industrial groups in which wood is an important raw material as in the manufacture of agricultural implements, musical instruments, etc., and others such as the manufacture of machinery in which wood is necessary but only in comparatively small proportion.

Wood is used indirectly in the manufacture of all-metal products such as wooden patterns and wooden foundry boxes in making metal castings. Wood in the form of barrels, boxes and other containers also enters into the distribution of commodities of all kinds.

In 1958 the wood-using group, comprising 4,079 establishments, gave employment to 73,159 persons and paid out \$226,881,505 in salaries and wages. The gross value of its products was \$797,294,220 and the net value \$338,124,109.

* Furniture; sash, door and planing mills; veneer and plywood; hardwood flooring; boxes, baskets and crates; wood-turning; coffins and caskets; cooperage; woodenware; lasts, trees and wooden shoe findings; beekeepers' and poultrymen's supplies; excelsior; and other wood-using industries.

The importance of secondary industry in providing employment will be appreciated when it is noted that the number of employees in the wood-using group was more than 73,000, as compared with sawmills with 47,763 employees and pulp and paper mills with 64,084 in 1958.

23.—Wood Used by Wood-Using Industries, 1955-58

Totals.....\$	247,810,786	273,494,141	246,623,490	241,763,730

Subsection 6.—The Paper-Using Industries

The paper-using group comprises three industries* engaged primarily in manufacturing commodities of paper and paperboard. Establishments engaged in printing, publishing, bookbinding and the allied graphic arts also consume large quantities of these materials but under the standard industrial classification adopted by the Dominion Bureau of Statistics in 1948 they are grouped separately.

Some paper-using establishments purchase paper as a raw material from the pulp and paper industry and merely subject it to some form of treatment to fit it for further manufacture in some other industry. This occurs in the manufacture of coated, sensitized or corrugated paper. Other firms purchase paper and subject it to some treatment to fit it for a definite final use such as in the manufacture of asphalt roofing or waxed wrapping paper. Another large group uses paper and paperboard as a raw material for conversion into paper bags, boxes, envelopes, laminated wallboard and other commodities.

The manufacture of containers and packages of various kinds has grown very rapidly since ways have been found of converting tough and cheap paper stocks into strongly made boxes which are replacing wooden crates and packing cases. Small attractive paper containers for use in the retail trade are growing in favour and constitute an important branch of the paper-using industries.

Composition roofing and sheathing, consisting of paper felt saturated with asphalt or tar and in some cases coated with a mineral surfacing, is being increasingly used as a substitute for metal roofing, wooden shingles and siding materials. Wood-fibre building boards, some of which are produced by lamination in the paper-using industries, are now used extensively in construction, especially for insulating purposes, replacing lumber and wood lath.

The growth of the paper-using industries in Canada since 1923 reflects these developments. In 1923 the 152 establishments in this group employed 6,870 persons, distributed \$7,442,102 in salaries and wages and produced goods valued at \$31,760,948. In 1958 these industries comprised 434 plants, provided employment for 28,851 persons whose earnings totalled \$102,162,620 and produced products worth \$494,781,213.

* Paper boxes and paper bags; roofing paper; miscellaneous paper goods.

Subsection 7.—Printing, Publishing and Allied Industries

The printing trades group is made up of five closely related industries: printing and publishing, comprised of publishers who operate printing plants; printing and bookbinding, including general or commercial printers and bookbinders; lithographing, comprised of plants specializing in that process; engraving, stereotyping and electrotyping, including photo-engraving; and trade composition or typesetting for printers. A sixth industry covering publishers of periodicals who do not print their own publications has been included since 1949. Although strictly speaking these publishers are not manufacturers, they are closely related to the printing trades which produce the plates, cuts, etc., and print newspapers, magazines, directories, yearbooks, almanacs, house organs and other periodicals for them.

In 1958 the manufacturing printing trades employed 66,359 persons whose earnings totalled \$270,873,584. Their output was valued at \$685,987,181 and the raw materials used and services received cost \$213,964,284.

Periodicals valued at \$283,961,775 accounted for 41.4 p.c. of the value of printed matter and other products, daily newspapers alone contributing \$207,584,197. The value of periodicals is made up of \$207,678,610 received from advertising and \$76,283,165 received from subscriptions and sales of publications. In addition, the 1,556 publishers in the sixth industry reported revenues of \$53,344,851 from advertising and \$14,228,206 from sales of publications.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Section 1.—Canada's Mineral Industry 1958-59*

Following the high point of \$2,190,322,392 reached in 1957, the value of mineral production declined slightly in 1958 but in 1959 the industry again assumed a steady rate of expansion and the value for that year reached an estimated \$2,400,000,000, a new record. Increased output of nickel, iron ore, copper, uranium, petroleum and asbestos accounted for most of the 1959 advance; the only significant declines were in gold, lead, tungsten and coal. Production increases occurred in each of the sectors of Canada's mineral industry in 1959, but the metallic minerals accounted for approximately 80 p.c. of the total increase. The metals made up 57 p.c. of the total value of Canada's mineral output, mineral fuels 23 p.c., structural materials 13 p.c. and non-metallics 7 p.c. The relative production values of these groups of minerals have not varied appreciably throughout the past decade, during which time the total value of mineral production rose from the 1949 level of \$900,000,000.

In output values, uranium, nickel, copper, iron ore, gold, zinc, lead and silver, in that order, were the most important metallic minerals in 1959 and accounted for 97 p.c. of the total value of the metal production. Although the outstanding growth rate in uranium output continued into 1959 when an all-time high of \$324,549,609 was reached, the United States Atomic Energy Commission announced late in 1959 that it would not exercise its options for the purchase of Canadian uranium after 1962. This led to a 'stretch-out' production plan for Canadian uranium producers for the period 1960-66. Consequently, the level of uranium production reached in 1959 may not be exceeded for many years. The nickel industry, which suffered a setback in 1958 as a result of a strike that lasted three months, operated at close to capacity in 1959. Producers are carrying

* Prepared under the direction of Dr. Marc Boyer, Deputy Minister of the Department of Mines and Technical Surveys, Ottawa, in the following Divisions of the Mines Branch: Introduction and Subsections 1 and 3 by officers of the Mineral Resources Division; Subsection 2 by H. M. Woodroffe of the Mineral Processing Division; and Subsection 4 by E. Swartzman of the Fuels and Mining Practice Division.

out considerable research to find new uses and markets for the metal. The copper industry also had a good year following difficulties in 1958 resulting from a world surplus. Price increases accompanied the rise in demand and production was resumed at some mines that had been closed since 1957.

From a resource development point of view, the iron ore industry continued to be one of the most favourable sectors of the Canadian economy. The 1959 shipments of 24,477,004 tons, 55 p.c. higher than those of 1958, seem likely to be doubled by 1965. Mine development under way in Quebec and Labrador will ensure a continuation of the rapid expansion in the industry. The import quotas on lead and zinc imposed by the United States in 1958 require that imports from Canada be reduced by 20 p.c. from the average of the period 1953-57. This restriction, along with lower prices, proved to be a hardship for Canadian producers. However, the price of zinc and the general market outlook improved for this metal in 1959. Gold production declined slightly in quantity in 1959 and the higher premium on the Canadian dollar lowered the domestic price of gold; consequently, the total value of output declined by approximately \$6,000,000. Silver production increased in 1958 and again in 1959.

In recent years asbestos has accounted for about 60 p.c. of the total value of output of the non-metallic group of minerals. Asbestos production in 1959 recovered from the setback experienced in 1958 and this recovery was accompanied by promising property developments in Newfoundland. Crude petroleum, Canada's leading mineral in point of annual value, suffered its first decline in production in 1958 after an unprecedented period of expansion following the Leduc, Alta., oil discovery of 1947. Somewhat improved markets in 1959 placed the crude oil industry again on a rising production trend. Natural gas resource development proceeded rapidly in 1958 and 1959 in anticipation of greatly increased export markets. Coal production continued the steady decline experienced throughout the 1950's. Cement, sand and gravel accounted for about two-thirds of the value of structural materials produced in 1958 and 1959. Unlike most other minerals, which are greatly affected by export market conditions, the structural materials continued to exhibit a growth rate that closely paralleled the expansion of the domestic economy.

The future holds much promise for the development of Canada's mineral wealth. Exploratory work of the past decade has greatly extended the country's mineral resource potential and production. Canada now leads the world in the production of nickel and asbestos and is a very close runner-up in the production of zinc and uranium. This country has a firmly established second place in the production of aluminum, platinum metals, gypsum and bismuth; it is third in the production of cadmium, gold, silver and titanium ores; and fourth in the production of magnesium, molybdenum, iron ore, barite and cobalt. In a world of rapidly growing population and rising standards of living in many regions, mineral demand over the long term can be expected to provide much opportunity for the continuing growth of the Canadian mineral economy, provided that production efficiency is constantly improved and all-important export markets are not unduly restricted.

Subsection 1.—Metals*

Uranium.—The value of uranium production exceeded that of any other metal in 1958 and 1959 as a result of the unprecedented rate of mine development that has characterized this new industry since 1955. Output of uranium oxide soared from 6,636 tons valued at \$136,304,364 in 1957 to 13,403 tons valued at \$279,538,471 in 1958 and to 15,497 tons valued at \$324,549,609 in 1959. However, this is the highest annual output that can be expected for some time.

The net result of the tremendous growth of the industry in the Western World is an over-supply of uranium. In 1959 the United States, the principal market for Canadian uranium, decided not to continue to purchase any from Canada in excess of its commit-

* The figures for 1958 in this Subsection are final but those for 1959, as well as some pertaining to individual companies in both years, are subject to revision.

ments which expire in 1962 and 1963. As a result, arrangements were made to allow Canadian companies to 'stretch out' to the end of 1966 the undelivered portion of the uranium under firm contract. The transfer of uranium sales contracts from one company to another is also permitted. The stretch-out plan was designed to allow the more economic producers to continue production until the late 1960's when it is hoped that the demand for uranium will increase sufficiently to provide adequate market outlets for the world's productive capacity.

Since May 1958, Canadian uranium producers have been allowed to sell any amount of surplus uranium to countries that hold bilateral agreements with Canada for co-operation in the peaceful uses of atomic energy. For all other countries, Canada may sell up to a maximum of 2,500 lb. of surplus uranium but, when this limit is reached for a given country, further sales are not permitted under present arrangements.

Ontario's output of 12,399 tons of uranium oxide (U_3O_8) in 1959 was about 80 p.c. of the Canadian total. Production in the Elliot Lake camp, the leading uranium producer in the world for the second consecutive year, reached an all-time high of 11,420 tons. The Elliot Lake orebodies contain 369,626 tons of uranium oxide which is sufficient for 30 years of operation at the present rate of production. Eleven mines were in operation in this area at the beginning of 1959 but in February the Spanish American mine, owned by Northspan Uranium Mines Limited, was closed. Two of the ten operating mines are owned by Algom Uranium Mines Limited, two by Northspan Uranium Mines Limited and one each by Can-Met Exploration Limited, Consolidated Denison Mines Limited, Milliken Lake Uranium Mines Limited, Pronto Uranium Mines Limited, Stanleigh Uranium Mining Corporation Limited and Stanrock Uranium Mines Limited. These mines produced 74 p.c. of the Canadian total in 1959.

The producing mines in the Bancroft area of Ontario are Bicroft Uranium Mines Limited, Canadian Dyno Mines Limited and Faraday Uranium Mines Limited. A fourth, Greyhawk Uranium Mines Limited, which had been shipping ore on a custom basis to the nearby Faraday treatment plant, was closed down in April 1959. The total ore reserves of the three producers are estimated at between 4,500,000 and 6,000,000 tons grading 0.09 p.c. U_3O_8 . During the latter part of the year production at the three mines was 3,800 tons of ore a day.

All uranium production in Saskatchewan comes from mines in the Beaverlodge Lake area on the north shore of Lake Athabasca. During 1959 six mines and three treatment plants were in operation. Production for the year was about 2,675 tons of uranium oxide valued at \$54,068,000, a slight decrease from that of 1958. The principal producers were Eldorado Mining and Refining Limited, Gunnar Mines Limited and Lorado Uranium Mines Limited. Lorado continued to treat ore on a custom basis from Lake Cinch Mines Limited, Cayzor Athabaska Mines Limited, Rix-Athabasca Mines Limited, the Lorado mine and from about eight smaller mining operations.

Production of uranium oxide in the Northwest Territories in 1959 amounted to 423 tons. Ore in the mine of Eldorado Mining and Refining Limited at Port Radium on Great Bear Lake is nearly exhausted and the mine is expected to close by the end of 1960. In July, Rayrock Uranium Mines Limited suspended operations at its Marian River mine owing to lack of ore.

The reserves of measured, indicated, and inferred uranium ore in Canada as of Nov. 1, 1959 were estimated at 321,000,000 tons grading 0.12 p.c. U_3O_8 , considered to be the largest in the world. Those of the Elliot Lake camp constitute about 94 p.c. of the Canadian total. The Beaverlodge and Bancroft camps each contain about 3 p.c. of the country's reserves.

Nickel.—Canada has long been the leading producer of nickel and in 1959 had 72 p.c. of the Free World production capacity. Canadian production in 1959 amounted to 185,123 tons valued at \$257,173,340, a gain in quantity of 33 p.c. over 1958 and close

to the all-time high of 1957. Other leading Free World producers in terms of production capacity percentage were New Caledonia (13 p.c.), Cuba (12 p.c.) and the United States (3 p.c.). Figures on the nickel production of the Union of Soviet Socialist Republics are not released but it is estimated to be 50,000 to 55,000 tons annually. Canada possesses the world's major nickel sulphide deposits. They have been the main source of the world nickel output for many years though in recent years production from lateritic nickel ores, especially those of Cuba and New Caledonia, has increased. Lateritic nickel deposits are relatively common compared with sulphide deposits and countries such as Cuba, the Dominican Republic, the Philippines and the Dutch East Indies have large reserves. Lateritic ores are treated chemically in contrast with the pyrometallurgical treatment of most Canadian sulphide ores. Production from lateritics can be expected to offer increasing competition to production from Canadian sulphide deposits.

The Canadian nickel industry is dominated by the mining and smelting operations of the Sudbury, Ont., district where the International Nickel Company of Canada Limited and Falconbridge Nickel Mines Limited have their mines and plants. International Nickel has five mines: the Creighton, Frood-Stobie, Garson, Levack and Murray. It has smelters at Copper Cliff and Coniston, the main product being nickel oxide sinter and by-products, copper, cobalt, the platinum metals, gold and silver, selenium, iron ore and sulphur. The sinter is used directly in industry or shipped to the Port Colborne, Ont., refinery where it is reduced, cast into anodes and either electrolytically refined or shipped to the company's Clydach refinery in the United Kingdom for reduction to metal. A newer method of treatment, in partial production, is the direct electrolysis of artificial sulphide anodes. In 1959 International Nickel's production capacity was 165,000 tons of refined nickel. Falconbridge Nickel Mines Limited obtains its ore from its Falconbridge, East and McKim mines in the Falconbridge area and from the Hardy, Longvack and Fecunis mines in the Onaping area. Concentrates are smelted at Falconbridge, producing a nickel-copper matte which is shipped to the company's refinery at Kristiansand, Norway. Falconbridge completed a large expansion program by the end of 1959 which raised its annual production capacity to 31,500 tons of nickel.

Sherritt Gordon Mines Limited has mining operations at Lynn Lake in northern Manitoba and a refinery at Fort Saskatchewan, Alta. The refinery employs a pressurized ammonia leach process and also treats custom ore concentrates shipped from North Rankin Nickel Mines Limited at Rankin Inlet on the west shore of Hudson Bay and from Giant Nickel Mines Limited near Hope, B.C. The Sherritt Gordon refinery has a capacity of 13,750 tons of nickel a year.

The outstanding current development in the Canadian nickel industry is the International Nickel Company's program at Thompson in northern Manitoba. This operation will be in production in 1961 at a rated capacity of 37,500 tons of nickel a year. The town of Thompson will be completely modern, designed for an initial population of 8,000 people and equipped with hospital and schools. The Thompson mine will have an initial daily capacity of 6,000 tons. A concentrator, a smelter and a refinery to produce electrolytic nickel are under construction. Ore reserves have not been released, though an official statement foresees sufficient ore for at least 100 years of production. Other important developments include the reopening of International Nickel's Crean Hill mine and further diamond drilling on the Strathecona deposit owned by Falconbridge. Both of these operations are in the Sudbury area. The Crean Hill mine is being prepared for production and, following the 1959 exploratory work at the Strathecona deposit, mine development work may be undertaken.

The ore reserves in the Sudbury area in 1958 were 264,628,000 tons for the mines of International Nickel and 43,892,750 tons for Falconbridge. Reserves of the Thompson mine in Manitoba are indicated to be approximately 200,000,000 tons, bringing the total for Canada to some 500,000,000 tons. Canada's position as the world's leading producer of nickel is therefore assured for many years to come.

Copper.—Production of copper in Canada reached a record high of 394,893 tons in 1959 valued at \$233,296,375 compared with 345,113 tons valued at \$174,430,930 in 1958. The world over-supply which had developed in 1957 and the first half of 1958 was wiped out by a series of production cuts and strikes in various parts of the world and an increased demand for copper in the United States. The greater demand for copper and the resulting price increases encouraged the reopening of some marginal producers that had suspended operations in 1957 and 1958 and the resumption of full production at other mines.

Copper production in Canada declined in 1958 owing to the strike at the mines of the International Nickel Company of Canada Limited which lasted from September to December, and to the closure of several relatively high-cost mines. International Nickel is Canada's largest producer followed by Hudson Bay Mining and Smelting Company Limited. Since 1958, Gaspé Copper Mines Limited has been the third largest, displacing the Horne mine of Noranda Mines Limited in that position.

Six smelters for the reduction of copper and copper-nickel ores and concentrates are operated in Canada. In the Sudbury area, International Nickel operates smelters at Copper Cliff and Coniston and Falconbridge Nickel Mines Limited produces copper-nickel matte at Falconbridge. Hudson Bay Mining and Smelting smelts concentrates from mines in Manitoba and Saskatchewan in its plant at Flin Flon, Man., and Noranda Mines Limited smelts ore and concentrates from the Horne mine and other mines in Eastern Canada at its smelter in Noranda. Gaspé Copper Mines treats concentrates from the Newfoundland Tilt Cove mine of Maritimes Mining Corporation Limited as well as from its own mine at Murdochville. The 329,239 tons of refined copper produced in 1958 came from Canada's two copper refineries, one operated by International Nickel at Copper Cliff, Ont., and the other by Canadian Copper Refiners Limited, a subsidiary of Noranda Mines Limited, at Montreal East, Que.

Newfoundland's copper production amounted to 14,751 tons in 1958 and to 15,777 tons in 1959. Production was obtained from the Tilt Cove mine and from the Buchans unit of American Smelting and Refining Company. Development and exploration continued at the property of Atlantic Coast Copper Corporation Limited in northeastern Newfoundland where production is planned for 1960.

Copper production in New Brunswick amounted to only 328 tons in 1958 and no production was obtained in 1959. Heath Steele Mines Limited closed its mine near Newcastle early in 1958. Exploration continued in the Newcastle-Bathurst area on a reduced scale and in 1959 the Consolidated Mining and Smelting Company of Canada Limited started shaft-sinking on the Wedge copper prospect.

Quebec produced 136,839 tons of copper in 1959 compared with 131,445 tons in 1958. The relative importance of the principal copper-producing districts is indicated by the 1958 statistics of production: mines in the Noranda-Val d'Or district—69,834 tons; Gaspé Copper Mines Limited at Murdochville in the Gaspé Peninsula—35,266 tons; and mines in the Chibougamau district—23,490 tons. The Noranda-Val d'Or district includes Noranda's Horne mine and the mines of Waite Amulet Mines Limited, Quemont Mining Corporation Limited, Normetal Mining Corporation Limited, Manitou-Barvue Mines Limited and East Sullivan Mines Limited. In the Chibougamau district are the mining operations of Campbell Chibougamau Mines Limited, Opemiska Mines Limited and Merrill Island Mining Corporation Limited. Other producers in Quebec in 1958 included Weedon Pyrite and Copper Corporation Limited—2,124 tons, and Anacon Lead Mines Limited—720 tons. Development work continued at several properties in the Chibougamau district and exploration was directed towards the Mattagami district of northwestern Quebec.

Ontario's copper production in 1959, at 186,747 tons, was about 31 p.c. higher than in 1958. Most of the production comes from nickel-copper mines in the Sudbury district. International Nickel continued production from its five mines in the district but its deliveries of refined copper declined to 105,235 tons in 1958 owing to the strike. In the

same area, Falconbridge Nickel Mines Limited operates six mines and produced 15,448 tons of copper in 1958. In the Manitouwadge area, Geco Mines Limited and Willroy Mines Limited produced steadily in 1958 and 1959. In 1958 Geco produced 30,455 tons of copper and Willroy 3,292 tons. Other Ontario copper producers are Temagami Mining Company Limited, which operates a copper-nickel-cobalt property on the east arm of Lake Temagami, and Nickel Rim Mines Limited with operations at a property in the Sudbury area which, however, were suspended in May 1958.

Copper production in Manitoba and Saskatchewan amounted to 50,111 tons in 1958 and to 48,967 tons in 1959. Saskatchewan's production comes from the portions of Hudson Bay Mining and Smelting Company's deposits that lie within the province, while Manitoba's output comes from that company's mines and from the deposits of Sherritt Gordon mines located in the Lynn Lake area of northern Manitoba. Hudson Bay produced 45,455 tons of copper in 1958 while Sherritt Gordon produced 4,945 tons. Hudson Bay continued development of the Coronation mine in Saskatchewan and the Stall Lake and Chisel Lake mines in Manitoba.

British Columbia's 1959 copper production was slightly higher than the 6,010 tons produced in 1958. Increased production was obtained from several mines that had closed in 1958 and were reopened in 1959. These include operations of the Howe Sound Company at Britannia Beach, the Phoenix Copper Company Limited at Phoenix, and Woodgreen Copper Mines Limited near Greenwood. Exploration was continued at the properties of Bethlehem Copper Company Limited in Highland Valley and Craigmont Mines Limited near Merritt.

North Rankin Nickel Mines Limited produced nickel-copper concentrates in 1958 and 1959 from its mine at Rankin Inlet on the west shore of Hudson Bay, N.W.T., which were shipped to the Sherritt Gordon refinery at Fort Saskatchewan, Alta.

Iron Ore.—Shipments of iron ore by Canadian producers reached an all-time high of 24,477,004 short tons in 1959 compared with the previous record of 22,348,278 short tons in 1956. The 1959 shipments were 55 p.c. greater than in 1958, the values of the 1959 and 1958 shipments being \$186,206,552 and \$126,131,181, respectively.

Imports from the Lake Superior area of the United States into Ontario, which have usually been over 4,000,000 short tons in recent years, were lower in 1958 owing to the general economic recession and an 86-day strike at one of the major Canadian iron and steel producers. Imports in 1959 were also low as a result of the steel strike which closed most United States iron ore mines. To enable Ontario blast furnace plants to operate at a high rate in 1959, a much larger percentage of the iron ore consumed was obtained from Canadian mines, particularly from Labrador-Quebec.

The United States is the principal market for Canadian iron ore. Because of the decline in steel demand there in 1958, exports decreased sharply. In 1959, despite the steel strike, the United States market for iron ore was strong. During the strike about 15 p.c. of the United States steel-making capacity continued to operate and, because no domestic ore was available, Canadian iron ore producers still had a market. The fear of an ore shortage during the 1959-60 winter led to an increase in stockpile facilities at United States ports, which permitted Canadian and other foreign producers to ship large tonnages during the strike.

Exports to Japan and western Europe, which are smaller but important Canadian customers, decreased in 1958. As industrial activity increased, the demand for Canadian iron ore, particularly in western Europe, strengthened towards the end of 1959. During 1958 it became evident that competition from other iron ore exporting nations, particularly Venezuela, will increase as the world enters into a period of relative iron ore abundance.

Iron Ore Company of Canada, with direct-shipping ore deposits astride the Labrador-Quebec border 360 miles north of the port of Sept Îles, Que., is the largest iron ore producer in Canada. This company accounted for about 60 p.c. of all 1959 shipments. Wabana Mines Limited, wholly owned subsidiary of Dominion Steel and Coal Corporation

Limited, produces heavy-media concentrate from its Bell Island, Nfld., operations and accounted for about 10 p.c. of Canadian shipments. About 3 p.c. of all 1959 shipments was in the form of pelletized iron ore concentrate from the Hilton Mines near Shawville, Que.

In Ontario, Steep Rock Iron Mines Limited and Canadian Charleson Limited have their operations based near Atikokan, 140 miles west of Port Arthur. Steep Rock supplies direct-shipping ore and some concentrate and in 1959 accounted for 12 p.c. of Canada's total shipments. Canadian Charleson commenced small-scale production of iron ore concentrate in 1958. Algoma Ore Properties Limited operates mines and a sinter plant near Jamestown in the Michipicoten area and accounted for 9 p.c. of 1959 shipments. Marmoraton Mining Company Limited produces pelletized iron ore concentrate at its plant near Marmora. Lowphos Ore Limited commenced production of iron ore concentrate in 1959 on a small scale near Capreol.

British Columbia accounted for about 4 p.c. of the total Canadian shipments in 1959. Most of the output, in the form of iron ore concentrates, is produced from mines operated by Empire Development Company Limited on Vancouver Island and Texada Mines Limited on Texada Island. Two new producers of iron ore concentrate on Vancouver Island made small shipments in 1959.

Three companies produce iron by-products from the processing of other raw materials. Two of these, namely, the International Nickel Company of Canada Limited (Copper Cliff, Ont.) and Noranda Mines Limited (Cutler, Ont.) treat iron sulphide material and obtain small tonnages of high-grade iron oxide. The third, Quebec Iron and Titanium Corporation, smelts ilmenite at its Sorel plant in Quebec to produce titania slag and pig iron. The ilmenite is mined from deposits at Allard Lake, Que.

The rapid increase in Canadian iron ore production during the past decade is expected to continue. Properties being developed for production will probably result in a doubling of Canada's 1959 shipments by 1965. In the Wabush Lake area of Labrador, 190 miles north of Sept Îles, Iron Ore Company of Canada and Wabush Iron Company Limited have very large deposits under development. They will spend over \$100,000,000 each in the next few years to bring their properties into production, the former in 1962 and the latter in 1965. In Quebec, Quebec Cartier Mining Company will spend up to \$300,000,000 on its project at Lac Jeannine, about 200 miles north of Shelter Bay on the St. Lawrence River. A deep-water harbour at the new town of Port Cartier, another new town near the mine site, a 193-mile connecting railway, a 60,000-hp. power development and a beneficiation plant were all started late in 1958. In Ontario, Caland Ore Company Limited neared the final stages of dredging the east arm of Steep Rock Lake. The mine development is well advanced and production in 1960 is expected to reach 750,000 tons. In British Columbia, the Consolidated Mining and Smelting Company of Canada Limited started the construction of a plant near Kimberley to produce 36,500 tons of pig iron from what was previously classified as iron oxide waste.

In many other parts of Canada a large number of companies continued to explore and evaluate several iron-bearing deposits of promise. Work to date suggests that there are large reserves—especially in Quebec, Newfoundland (Labrador) and Ontario—of concentrating grade iron ore, some of which are likely to be developed as the demand for iron ore increases.

Gold.—Conditions in Canada's gold mining industry had improved in 1958 over 1957. The average Mint price for gold increased to \$33.98 an ounce troy from only \$33.55 in 1957. Production rose to 4,571,347 oz. t. from 4,433,894 oz. t. and the value increased to \$155,334,370 from \$148,757,143. However, the improvement did not continue in 1959 when production amounted to 4,444,845 oz. t. valued at \$149,213,447. The premium on the Canadian dollar in relation to that of the United States rose, resulting in an average Mint price for gold of only \$33.57 in 1959.

The Emergency Gold Mining Assistance Act in 1958 was extended to the end of the calendar year 1960, with a 25-p.c. increase in cost assistance. The Speech from the Throne in January 1960 announced the Government's intention of extending the Act for a further three-year period, at the same rate of assistance. Recent increased cost assistance was largely offset, however, by increases in labour and material costs and by the lower gold price.

Ontario produces 60 p.c. of Canada's total gold output. Estimates show a 1959 total for the province of 2,666,535 oz. t., compared with 2,716,514 oz. t. in 1958. Increases occurred in the Larder Lake, Patricia and Sudbury districts and declines in Porcupine, Kirkland Lake and Thunder Bay. Thirty lode gold mines were operating, the same number as in 1958. Thirteen lode gold mines were in operation in the Porcupine area in 1959, Hollinger Consolidated Gold Mines Limited, McIntyre Porcupine Mines Limited and Dome Mines Limited being the principal producers; output from Hollinger and Dome decreased while that from McIntyre increased. In the Larder Lake district, output from Kerr-Addison Gold Mines Limited, Canada's largest gold producer, reached a new high of 567,305 oz. t. and was 4.5 p.c. more than in 1958. In the Kirkland Lake district, seven mines were in operation in 1959, Wright-Hargreaves Mines Limited, Macassa Mines Limited and Lake Shore Mines Limited being the leading producers; output from the first two was higher and that from Lake Shore lower than in 1958. In the Patricia area, six mines were in operation, the chief producers being Campbell Red Lake Mines Limited, Madsen Red Lake Gold Mines Limited and New Dickenson Mines Limited; production from Campbell Red Lake was higher than in 1958 and sizable increases were recorded by Cochenour Willans Gold Mines Limited, and McKenzie Red Lake Gold Mines Limited. Production from Pickle Crow Gold Mines Limited at Pickle Lake was 23 p.c. lower. In the Thunder Bay district, output from McLeod-Cockshutt Gold Mines Limited increased in 1959 but that from Leitch Gold Mines Limited declined by 11 p.c. Renabie Mines Limited in the Sudbury district recorded a 30-p.c. increase in output.

Quebec produced 985,829 oz. t. of gold valued at \$33,094,280 in 1959 compared with 1,044,846 oz. t. valued at \$35,503,867 in 1958, output in 1959 being 22 p.c. of the Canadian total. Approximately 39 p.c. of Quebec's gold is obtained as a by-product from the large base-metal mines in the province. Twelve lode gold mines were in operation at the end of 1959, the chief producers being Lamaque Gold Mines Limited and Sigma Mines (Quebec) Limited in the Bourlamaque area, both with a lower output than in 1959, and East Malartic Mines Limited in the Malartic area with a higher output. Stadacona Mines (1944) Limited at Rouyn was closed at the end of 1958 and Belleterre Quebec Mines Limited near Ville Marie in February 1959. One new producer, Norlartic Mines Limited in the Malartic area, started shipping ore to the Malartic Gold Fields Limited mill in June 1959. In the Cadillac-Malartic district, outputs from Barnet Mines Limited, Canadian Malartic Gold Mines Limited and Malartic Gold Fields Limited were lower than in 1958. Output from Bevecon Mines Limited in the Bourlamaque-Louvicoourt district was 10 p.c. lower than in 1958. Sullivan Consolidated Mines Limited in this area was reopened in August 1958 after a two-year shutdown and had a full year's production. Elder Mines Limited and its subsidiary Eldrich Mines Limited in the Noranda area recorded declines. In the Chibougamau area the operation of Anacon Lead Mines Limited, which is classed as a lode gold mine even though it produces some copper, was closed for 166 days in 1959 while shaft sinking proceeded.

Gold production in the Northwest Territories in 1959 amounted to 399,176 oz. t. valued at \$13,400,338 compared with 343,838 oz. t. valued at \$11,683,615 in 1958. The output in both years came from four lode gold mines and the increase in production resulted from a 45-p.c. increase from the Giant Yellowknife mines, the largest gold mine in the Territories. Consolidated Discovery Yellowknife Mines Limited, the second largest producer, maintained production at the 1958 level whereas output from the Con and Rycon mines of the Consolidated Mining and Smelting Company of Canada Limited was lower than in 1958. There was an increase in exploration activity in 1959. Taurcanis Mines Limited, some 100 miles northeast of Yellowknife, sank its shaft a further 300 feet

and was developing two new levels. Ruth Gold Mines Limited leased the Ruth property, 57 miles east of Yellowknife, from Consolidated Mining and Smelting Company of Canada Limited and recovered a small amount of gold. Many other gold prospects were being explored in the Yellowknife area.

British Columbia produced 178,749 oz. t. of gold valued at \$6,000,604 in 1959 compared with 210,612 oz. t. valued at \$7,156,596 in 1958. The two largest of the four lode gold mines—Bralorne Mines Limited and Pioneer Gold Mines of B.C. Limited—in the Bridge River area amalgamated during 1959 under the name of Bralorne Pioneer Mines Limited. Bralorne maintained its 1958 level of production but Pioneer's was 29 p.c. lower in 1959. The Cariboo Gold Quartz Mining Company Limited at Wells and its subsidiary, French Mines Limited at Hedley, produced less than in 1958. There was some increase in gold placer activities in the Wells and Atlin area. Camp McKinney Gold Mines Limited reopened a former lode gold producer near Rock Creek, and Bedwell River Gold Mines Limited reopened the old Musketeer mine on Vancouver Island and recovered a small amount of gold.

Placer mining operations accounted for most of the Yukon gold output of 68,396 oz. t. valued at \$2,296,054 in 1959, the remainder being gold recovered as a by-product by United Keno Hill Mines Limited. Output in the Yukon in 1958 was 67,745 oz. t. valued at \$2,301,975.

In the Prairie Provinces, gold production comes from two lode mines in Manitoba where it is recovered as a by-product from the base-metal mines at Flin Flon and Lynn Lake. Some placer gold is also recovered from river gravels near Edmonton. In Manitoba, gold production dropped to 51,711 oz. t. from 87,356 in 1958 and in Saskatchewan to 80,694 oz. t. from 86,590. The decline in Manitoba resulted primarily from the closing of the Nor-Acme mine at Snow Lake in July 1958. This mine was being worked under lease by Britannia Mining and Smelting Company Limited. Output from San Antonio Gold Mines Limited and its subsidiary, Forty-Four Mines Limited at Rice Lake, was lower than in 1958. An internal shaft is being sunk at Forty-Four to develop more ore at depth if possible.

Gold production from the Maritime Provinces amounted to only 50 oz. t. in 1959 and 183 oz. t. in 1958, all of it from Nova Scotia in 1959 and from Nova Scotia and New Brunswick in 1958. In Newfoundland, gold is recovered as a by-product from the base-metal operations of Buchans Mining Company Limited at Buchans and Maritimes Mining Corporation Limited at Tilt Cove. Gold recovered in 1959 increased slightly to 13,518 oz. t. from 13,381 oz. t. in 1958.

The outlook for Canada's gold mining industry is dependent largely upon any improvement that may occur in the cost-price relationship. Faced with a fixed price of \$35 an oz. t., United States currency, and the fluctuating exchange rate on the Canadian dollar in relation to that currency, the industry has depended greatly on the cost-aid provided by the Emergency Gold Mining Assistance Act.

Lead and Zinc.—The growth of the Canadian lead and zinc mining industry was retarded throughout 1958 and 1959 by unsettled prices and by quotas imposed by the United States to hold its imports of lead and zinc to 80 p.c. of the 1953-57 average. In 1958 lead prices fell in June from 12½ cents a pound to 10½ cents and then advanced to 11½ cents in the last quarter of the year. The price of lead in 1959 settled from the high of 11½ cents a pound recorded during the first week in January to 10½ cents by early September at which level it stayed for the remainder of the year. Compared with 1957, production of lead in 1958 increased 2.9 p.c. in volume to 186,680 tons but decreased 17 p.c. in value to \$42,413,805. Production in 1959 amounted to 186,495 tons valued at \$39,574,191.

Exports of lead in 1958 totalled 146,432 tons compared with 129,191 tons in 1957. Of this amount, 54,081 tons were contained in concentrates, almost all of which were shipped to the United States (23,460 tons), Belgium (16,223 tons) and West Germany (13,781 tons). Refined lead exports totalled 92,351 tons, of which the United Kingdom imported 49,841 tons, the United States 40,503 tons and other countries 2,007 tons. According to preliminary export figures, a small decrease in exports occurred in 1959.

The price of prime western zinc was 10 cents a pound from the beginning of 1958 to early October when it was increased to 10½ cents. By the middle of November the price reached 11½ cents a pound where it held for the remainder of the year. Early in January 1959 the price advanced to 11¾ cents a pound and by mid-October, after several declines and advances, it reached 12¾ cents where it stayed for the remainder of the year. Zinc output in 1959 was 394,458 tons valued at \$96,563,324 compared to the 1958 output of 425,099 tons valued at \$92,501,496.

Exports in 1958 of refined zinc and zinc in concentrates totalled 413,531 tons compared to 389,148 tons in 1957. The United States was by far the largest importer, receiving 95,395 tons of refined zinc and 162,849 tons of zinc in concentrates. The United Kingdom was the next largest importer, receiving 83,854 tons of refined zinc. Other important importers were Belgium and Norway which together imported 26,733 tons of zinc in concentrates. Altogether some 17 countries imported zinc from Canada. Compared with 1958, estimated exports of zinc during 1959 indicate a drop of about 10 p.c.

Canadian consumption of all forms of lead in 1958 was 84,646 tons compared with 81,183 tons in 1957. Zinc consumption increased from 54,420 tons in 1957 to 57,542 tons in 1958. Preliminary data for 1959 show that a large increase in zinc consumption occurred but that lead consumption decreased.

British Columbia mines accounted for about 80 p.c. of Canada's lead production and 51 p.c. of the zinc production in 1958-59. The principal producer of both metals is the Consolidated Mining and Smelting Company of Canada Limited (Cominco), operator of the Sullivan mine and 11,000-ton mill at Kimberley, the Bluebell mine and 500-ton mill at Riondel, and the H.B. mine and 1,000-ton mill at Salmo. Concentrates from all of Cominco's mines and those from other mines in British Columbia, Yukon and some foreign areas were treated at the company's smelter at Trail. Other important British Columbia producers of lead and zinc in 1958-59 included: Canadian Exploration Limited and Reeves MacDonald Mines Limited, both near Salmo; Sheep Creek Mines Limited, west of Invermere; and Howe Sound Company Limited, north of Vancouver. Torbrit Silver Mines Limited, north of Prince Rupert, produced lead but no zinc. The company ceased mining and milling in October 1959, however, owing to lack of ore. The Britannia copper-zinc mine operated by Howe Sound was reopened in January 1959 after being closed for nine months.

United Keno Hill Mines Limited was the only important producer of lead and zinc in the Yukon. Commercial production from its Elsa mine commenced in 1958.

In Manitoba and Saskatchewan, Hudson Bay Mining and Smelting Company Limited is the only producer of zinc. Four mines near Flin Flon produce ore for treatment at the Flin Flon concentrator. One of these, the North Star, was closed in March 1958 following the mining out of the orebody. The company's electrolytic zinc plant at Flin Flon operated at close to its rated capacity of 190 tons a day in 1959. No lead is produced in the two provinces.

In Ontario, zinc concentrates and a small amount of lead concentrates were produced by Geco Mines Limited and Willroy Mines Limited in the Manitouwadge district, north of Lake Superior.

The principal sources of zinc concentrates in Quebec in 1958-59 were: the copper-zinc mines in the Noranda-Val d'Or district operated by Quemont Mining Corporation Limited; Manitou-Barvue Mines Limited; Normetal Mining Corporation Limited; and Waite-Amulet Mines Limited. Quebec's main lead producer was New Calumet Mines Limited whose mine is 70 miles west of Ottawa. Manitou-Barvue also produced lead concentrates. The West MacDonald mine in Dufresnay township, operated by West MacDonald Mines Limited, and the Weedon mine, about 40 miles northeast of Sherbrooke, operated by Weedon Mining Corporation Limited, produced some zinc in 1958 but both were closed in 1959.

In the Atlantic Provinces, the Buchans unit of American Smelting and Refining Company Limited in Newfoundland remained the only producer in 1958-59 after Heath Steele Mines Limited ceased operating its mine near Newcastle, N.B., in March 1958.

Exploration and development activities during 1958-59 were centred in the Snow Lake area of Manitoba, 70 miles east of Flin Flon, and in the Watson Lake area of Quebec, 100 miles north of Senneterre. Two properties in the Snow Lake area owned by Hudson Bay Mining and Smelting Company Limited are scheduled for production in 1960. Several large deposits containing mainly zinc and copper values and over 23,000,000 tons of ore have been outlined in the Watson Lake area by diamond drilling.

Silver.—Canada's silver production in 1959 was 32,329,137 oz. t. valued at \$28,381,750 compared with 31,163,470 oz. t. in 1958 valued at \$27,053,007. Practically all of the 1959 increase came from British Columbia and the Yukon, their total production being 1,147,196 oz. t. greater than in 1958. Significant increases in silver recovery from lead-zinc ores in British Columbia and the mining of richer silver ore at the United Keno Hill mines in the Yukon account for most of the greater recovery.

The three leading silver producing countries in 1958 were Mexico (47,000,000 oz. t.), United States (36,800,000 oz. t.) and Canada (31,200,000 oz. t.). Silver consumption in Canada in 1958 declined to 8,600,000 oz. t., 1,100,000 less than in 1957. The arts and industries required 3,900,000 oz. t. and the remainder was used in coinage. Final figures for world consumption of silver in 1959 are not available, but preliminary returns indicate that world demand in the latter part of 1959 was far greater than in corresponding periods of previous years.

Most of Canada's silver output is recovered as a by-product of base-metal ores treated at smelters in Canada and abroad. The principal producer is the Consolidated Mining and Smelting Company of Canada Limited (Cominco) which recovers silver in the refined form from lead-zinc and silver-lead-zinc ores treated at Trail, B.C. Cominco in 1958 produced 12,875,160 oz. t. of silver, equal to about 41 p.c. of the total Canadian production. Other important producers of silver are: the copper refinery in Montreal East, Que., operated by Canadian Copper Refiners Limited; the silver-cobalt refinery at Deloro, Ont., operated by Deloro Smelting and Refining Company Limited; the copper refinery at Copper Cliff, Ont., operated by the International Nickel Company of Canada Limited; and the gold bullion refineries at Timmins and Ottawa, Ont., operated by Hollinger Consolidated Gold Mines Limited and the Royal Canadian Mint, respectively.

United Keno Hill Mines Limited, Canada's largest single source of silver, produced about 7,308,000 oz. t. of the metal in the year ended Sept. 30, 1959—a new record. Production during the corresponding period in 1957-58 was 5,984,373 oz. t. The increase was attributable to the high-grade ore mined from the company's Elsa mine which completed its first full year of commercial production about mid-1959. Other leading silver producing companies were Highland-Bell Limited and Torbrit Silver Mines Limited, both in British Columbia, and Agnico Mines Limited and Siscoe Metals of Ontario Limited, both in Ontario. These four companies in 1958 together produced 5,212,090 oz. t. The Torbrit silver mine was closed in October 1959 owing to exhaustion of ore reserves after more than nine years of almost continuous operation.

The average Canadian price of silver in 1959 was 87.82 cents an oz. t. compared with 86.78 cents in 1958.

Platinum.—Canada is the second largest producer of the platinum group of metals, following the Union of South Africa. The output is derived from the smelting and refining of nickel-copper ores of the Sudbury district of Ontario. International Nickel and Falconbridge Nickel are the main producers, recovering the refined metals at their respective refineries near London, England, and Newark, New Jersey. Output of platinum in 1959 was 149,510 oz. t. valued at \$10,951,608 while in 1958 it was 146,092 oz. t. valued at \$9,481,371. Recent production of platinum is considerably lower than the postwar high of 199,565 oz. t. reached in 1957. Output of other metals of the platinum group in 1959 was 170,160 oz. t. valued at \$5,662,499 while in 1958 it was 154,366 oz. t. with a value of \$4,840,072.

Titanium.—Ilmenite, an iron-titanium oxide, is mined in the Allard Lake and St. Urbain areas of Quebec. During 1959 most of the Allard Lake ore was smelted by Quebec Iron and Titanium at Sorel, Que., to produce a high titania slag. Most of this slag is shipped to United States pigment producers and some goes to the Canadian market. Ilmenite from St. Urbain is sold as heavy aggregate and some of it is exported for the production of slag and ferrotitanium.

Cobalt.—Cobalt occurs in the copper-nickel ores of the International Nickel Company of Canada Limited and Falconbridge Nickel Mines Limited in the Sudbury area. International Nickel recovers the cobalt from its nickel refining operations at Port Colborne, Ont., and Clydach, Wales. Falconbridge recovers it in the refining of nickel-copper matte at its refinery at Kristiansand, Norway. Cobalt contained in the silver ores of the Cobalt-Gowganda area of Ontario is recovered by Deloro Smelting and Refining Company Limited at its smelter at Deloro, Ont. Sherritt Gordon Mines Limited produces refined cobalt and nickel-cobalt powder at its nickel refinery at Fort Saskatchewan, Alta., by refining nickel-copper concentrates shipped from its mine at Lynn Lake, Man. Canadian production of cobalt during 1959 was 3,298,328 lb. valued at \$5,927,003, an improvement over the 1958 output of 2,710,429 lb. valued at \$5,308,298 but below the record of almost 4,000,000 lb. set in 1957.

Tungsten.—During 1958 tungsten production from the operations of Canadian Exploration Limited at Salmo, B.C., amounted to 690,976 lb. of tungstic oxide (WO_3) valued at \$1,898,455. There were no other producers. In 1959 there was no production at Salmo, this being the first year since 1946 in which Canada did not produce tungsten ore.

Molybdenum.—Molybdenite Corporation of Canada Limited was the sole Canadian producer of molybdenite and molybdic oxide in 1959. Shipments from the company's mine at Lacorne, 23 miles northwest of Val d'Or, Que., amounted to 850,000 lb. of contained molybdenum valued at \$1,105,000 compared with 888,264 lb. valued at \$1,152,838 in 1958.

Selenium.—Selenium is derived from the refining of blister copper by Canadian Copper Refiners Limited at Montreal East where the company operates the largest selenium metal-and-salts plant in the world. International Nickel also produces selenium at Copper Cliff, Ont. Production in Canada in 1959 totalled 564,415 lb. valued at \$3,849,905 and in 1958 it was 306,990 lb. valued at \$2,302,426.

Magnesium.—Magnesium was produced by two companies in 1959. One of these, Magnesium Company of Canada Limited, ceased operations in September at Wakefield, Que., where it was mining a brucitic limestone. The sole producer in Canada at the end of 1959 was Dominion Magnesium Limited. Its thermal reduction plant and adjacent dolomite quarry are located at Haley, Ont. Production of magnesium in 1959 amounted to 11,633,213 lb. valued at \$3,489,964 compared with 13,591,705 lb. valued at \$4,064,825 in 1958.

Other Metals.—Canada also produces small quantities of antimony, bismuth, cadmium, calcium, tellurium, thorium and tin, largely as by-products in the refining of base metals. Of these minor metals, cadmium with a 1959 production valued at \$2,636,456 and tin valued at \$931,840 are the most important.

Subsection 2.—Industrial Minerals

The total value of industrial mineral production in 1959 reached an all-time high of \$490,545,000, reflecting Canada's continuing industrial growth. Several of the non-metallics contributed substantially to the increase of 14 p.c. over the 1958 total mineral production. New highs were established for gypsum, lime, nepheline syenite, salt, talc and soapstone, cement, clay products, sand and gravel; other non-metallics, including asbestos, recorded gains. The highlights of development in the industry during 1959 are outlined below.

Sulphur.—With the development of natural gas fields in the west, Canada is becoming an important source of elemental sulphur. Seven years ago Canadian needs for this commodity were met entirely by imports; today export outlets are essential to provide a market large enough to absorb the growing production.

Although pyrite, other sulphides and smelter gas are still the sources providing the greater part of the output of elemental sulphur, in 1959 about 30 p.c. of the total was recovered as a step in preparing sour natural gas for transmission to market by pipeline. By the end of the year there were in operation six recovery plants in Alberta, one in Saskatchewan and one in British Columbia, together capable of producing 590,000 long tons of elemental sulphur annually. Twelve additional plants were in various stages of planning, their construction depending on the development of markets for natural gas. With these plans fulfilled, Canadian recovery of elemental sulphur is expected to reach an estimated 2,000,000 tons per annum.

One of the important contributions to elemental sulphur production during 1959 was the completion by British American Oil Company Limited of a third recovery unit at its Pincher Creek plant in Alberta, increasing daily capacity to 678 long tons. The addition makes this the largest operation of its kind in the Commonwealth, and one of the world's major plants for recovering sulphur from sour natural gas. A new well with a daily open flow yield of over 200,000,000 cu. feet of raw gas was brought into production in the Pincher Creek field. At Okotoks, 20 miles south of Calgary, the extraction plant constructed jointly by Texas Gulf Sulphur, Devon Palmer Oil and Shell Oil was placed on stream on May 31. Erected at a cost of \$8,000,000, it is capable of processing daily 30,000,000 cu. feet of sour gas from the Okotoks field and extracting 375 tons of sulphur. At Nevis, Alta., B.A. Oil extended its gas processing plant to recover 75 tons of sulphur a day from Nevis field gas, which contains 6.8 p.c. H_2S .

Elemental sulphur is also being recovered in Eastern Canada. Laurentide Chemicals and Sulphur Limited, with a reported capacity of 100 tons daily, is recovering it at Montreal East from the petroleum wastes of five refineries located there. The International Nickel Company of Canada Limited is recovering this element at the Port Colborne refinery during the electrolysis of nickel matte. Since April, International Nickel and Texas Gulf Sulphur Company have operated a pilot plant near Copper Cliff, Ont., extracting elemental sulphur during the roasting of pyrrhotite concentrates.

Canada's emergence as one of the world's leading nations in the production of elemental sulphur appears assured. As the plans of the industry are completed, production will be considerably above domestic requirement and the creation of an export market is vital. With production costs comparable to or less than those of the established foreign sources, the main problem is cost of transportation to the larger marketing areas. In world markets, Canadian sulphur will be competing with Frasch sulphur from the United States and Mexico and the new by-product source at Lacq in southern France. The latter source is expected to reach an annual productive capacity of 1,400,000 tons by 1962.

Potash.—More than ten years of exploration and development in Western Canada were brought to a successful conclusion by Potash Company of America Limited when, late in 1958, it commenced production from Canada's first potash mine, situated at Patience Lake, 14 miles east of Saskatoon. Lying beneath a large area of southern Saskatchewan and southwestern Manitoba is believed to be the world's largest high-grade deposit of potash. Reserves indicated by drilling have been over 25 p.c. K_2O . The beds dip flatly to the southwest. The shallowest deposits found in place to date are at depths ranging from 2,800 feet near the Saskatchewan-Manitoba boundary east of Esterhazy to 3,335 feet near Saskatoon and 3,450 feet near Unity. Deposits of economic interest have been found only in Saskatchewan and in a small area in Manitoba along the Saskatchewan boundary. Potash minerals, mainly sylvite (KCl) and carnallite ($KCl \cdot MgCl_2 \cdot 6H_2O$), occur in three zones that are fairly distinct and continuous but vary in thickness and grade at different locations.

The importance of this source of one of the three major elements in fertilizers (nitrogen, potassium and phosphorus) is recognized in the large areas leased from the Saskatchewan Government and currently under exploration, and in the number of international companies participating. In addition to the Potash Company of America Limited which has completed its installation, two other companies have shafts partly completed: International Minerals and Chemical Corporation (Canada) Limited at Esterhazy, which mine is expected to be in production during 1961 with a capacity of 400,000 tons of potash salts annually; and Continental Potash Limited which plans to resume shaft-sinking eight miles west of Unity where potash occurs at a depth of 3,450 feet. At the end of 1959, 12 other companies representing Canadian, German, French and American interests were holding potash leases in Western Canada. Activity is centred mainly in a 25-mile belt extending southeast from Yorkton in Saskatchewan to the Manitoba boundary and in a central belt extending from west of Saskatoon to the Quill Lakes.

Though world potash mining capacity exceeds present-day consumption, the use of fertilizers is growing rapidly in many areas to meet the rising demand for agricultural production. For this reason, the Saskatchewan deposits have received the serious attention of the international potash industry.

Salt.—The salt industry in Canada has experienced a period of remarkable expansion. Production has almost doubled since 1957 and more than tripled in the past six years. In 1959, the fifth successive record year, output climbed to an estimated 3,233,512 tons valued at \$17,462,050, increases over 1958 of 36 p.c. and 16 p.c., respectively. This growth reflects the expanding market for mined rock salt, increased exports particularly of brine, and the growth of the chemical industry.

During 1959, two new rock salt mines came into production. At Goderich, Ont., Sifto Salt Limited, a subsidiary of Dominion Tar and Chemical Co. Ltd., began mining a 45-foot bed of excellent purity salt from a deposit lying beneath Lake Huron at a depth of 1,750 feet. Reserves are estimated at 900,000,000 tons. Salt mined at Goderich will be sold in the domestic and export markets for ice control and for industrial uses. In the Maritimes where there is a large market for coarse salt for fisheries, Malagash Salt Company Limited completed a new mine at Pugwash, N.S. A mine at Malagash, operated by the same company, was closed down as Pugwash came into operation.

Salt is produced at ten other plants located in Alberta, Saskatchewan, Manitoba, Ontario and Nova Scotia.

Asbestos.—Canada occupies the most prominent position in world asbestos, recovering one-half the total production. During 1959, Canadian asbestos mines increased their shipments by 13 p.c., marketing 1,042,000 tons of fibre with a value in excess of \$106,000,000.

Chrysotile, the most widely used variety of asbestos, occurs in several places in Quebec, Ontario, British Columbia and Yukon Territory. The main centre of the industry is in the Eastern Townships region of Quebec where 12 mines account for 94 p.c. of the Canadian production. Elsewhere in Canada there are two mines, one in northern Ontario and one in northern British Columbia.

During 1959, Cassiar Asbestos Corporation Limited increased the capacity of its mill in British Columbia by 50 p.c. to 1,500 tons daily. The deposit mined by Cassiar yields long and medium length of fibre characterized by a low iron content rendering it of particular interest to the electrical industry. Advocate Mines Limited continued exploration and development of a new deposit at Baie Verte on the Burlington Peninsula, Newfoundland, and a new deposit of chrysotile was discovered 30 miles south of Deception Bay in Ungava.

Construction Materials.—In 1959, as a result of the continued activity in building and road construction across the country, mineral raw materials were produced for construction needs at a record level, slightly above that of 1958. Producers' shipments of cement, clay products, lime, sand, gravel and stone exceeded \$314,000,000 in value.

The output of Canadian cement plants increased 2.3 p.c. in 1959 to 6,300,000 tons. For a number of years following World War II, considerable quantities of this commodity were imported into Canada; today, imports are insignificant and the industry is exporting about 5 p.c. of its production to the United States. A major development in 1959 was the construction of a large plant at Montreal by the firm Miron et Frères Ltée. A 500-by-15 ft. rotary kiln, the largest in Canada, with a capacity of 4,000,000 bbl. of clinker annually, was installed. This new operation raised the number of cement plants in Canada to 19 and their combined capacity to more than 8,500,000 tons annually. Saskatchewan Cement Corporation Limited completed a \$1,000,000 addition to its plant near Regina, and the capacity of the Edmonton plant of Inland Cement Company Limited was increased by 50 p.c.

In recent years the consumption of 'ready mixed' concrete has grown remarkably and more than 25 p.c. of all the cement used in Canada is now marketed in this form.

Crushed stone, sand and gravel used by the construction industry were produced in 1959 to a value of more than \$151,000,000, substantially the same as in 1958. This industry is being kept active by the accelerated road-building programs under way throughout the country.

In the lightweight aggregate industry, two new plants came into production during 1959. At St. François du Lac near Sorel, Que., Featherrock Incorporated began operating, at mid-year, a two-kiln plant using local clay and producing a coated aggregate. Late in the year British Columbia Lightweight Aggregates Limited completed a one-kiln plant on Saturna Island east of Sidney, B.C.

The clay products industry reported an 8-p.c. gain over 1958 with a value of production exceeding \$45,000,000, a new record. To keep up with the demand for building-brick, a new tunnel kiln was installed at the Laprairie plant of Cooksville-Laprairie Brick Limited, and a new tunnel kiln plant was erected at Hamilton, Ont., by Diamond Clay Products Limited. New equipment was installed by Medicine Hat Brick and Tile Company Limited for the manufacture of coloured, glazed-face brick. Production of this type of brick, the first in Western Canada for many years, reflects the use of more decorative types of brick and tile in keeping with modern trends in architectural design.

Subsection 3.—Petroleum and Natural Gas

The petroleum and natural gas industry resumed its customary rate of growth in 1959 after the setback in 1958, the first that had occurred in more than a decade. Production of crude oil and natural gas reached record levels in 1959 and the production advances were reflected in increased pipeline deliveries and higher domestic sales. In 1959 a total of 184,500,000 bbl. of crude oil valued at \$427,000,000 and of 427,804,000,000 cu. feet of natural gas valued at \$40,000,000 were produced. Exploration as a whole continued to decline slightly as a result of the large proportion of shut-in production capacity awaiting greater market outlets. The total geophysical crew-months worked in 1959 amounted to 825, down 22 p.c. from 1958 and 38 p.c. from 1957. Exploratory drilling activity was maintained and about 900 wells were completed. The most active exploratory areas were in the foothills region of Alberta and in northeastern British Columbia, where natural gas search was under way, and northwest of Edmonton in Alberta where oil discovery was the chief objective. Despite the over-all decline in exploratory activity, more emphasis than ever before was placed on exploration in areas where natural gas is more likely to be found. This was being done in anticipation of increased sales as markets in Eastern Canada and British Columbia expand and because of the prospect of increased exports to the United States.

Reserves of petroleum and natural gas were raised substantially. At the end of 1959 reserves of crude oil totalled 3,400,000,000 bbl. and proved recoverable reserves of natural gas amounted to 26,600,000,000,000 cu. feet.

Capital investment in the oil and natural gas industry during 1959 was close to \$600,000,000 in all phases: exploration, development, production, transportation, refining and marketing. This brought the total amount invested in the Canadian industry since 1946 to almost \$5,000,000,000.

The rate and scale of development of the petroleum and natural gas industry in Western Canada in recent years is indicated by the following production data.

1.—Crude Oil and Natural Gas Production in Western Canada, 1954-59

Year	Crude Oil				Natural Gas			
	Man.	Sask.	Alta.	B.C.	Man.	Sask.	Alta.	B.C.
	'000 bbl.	'000 bbl.	'000 bbl.	'000 bbl.	'000,000 cu. ft.	'000,000 cu. ft.	'000,000 cu. ft.	'000,000 cu. ft.
1954.....	2,148	5,423	87,714	—	—	3,333	107,174	—
1955.....	4,146	11,317	113,035	—	—	6,707	133,007	—
1956.....	5,787	21,077	143,910	148	—	9,808	146,134	188
1957.....	6,090	36,861	137,492	341	—	13,994	183,141	8,275
1958.....	5,829	44,626	113,278	512	—	18,820	239,050	63,638
1959.....	5,100	48,500	128,700	824	—	34,000	309,000	67,622

The natural gas figures given in Table 1 do not include gas flared in the field, which in 1954 amounted to about 20 p.c. of gross gas production. The quantity of gas flared rose to 27 p.c. of production during 1956 and 1957 and declined in 1958 to 19 p.c. The rising demand for natural gas and the higher prices offered will permit the economic gathering of more and more gas that might otherwise be wasted.

British Columbia.—In British Columbia, exploration primarily directed towards natural gas has extended to the northern limits of the province. Discoveries in 1959 east and north of Fort Nelson and subsequent tests indicate the presence of major gas resources. Exploratory work at the year-end had extended northward across the border into the Northwest Territories. Farther to the south, about 100 miles northwest of Fort St. John, development drilling in natural gas fields was continued at a rate comparable with 1958 to meet the immediate needs of Westcoast Transmission Company which transports natural gas to the Pacific Coast. In all, 41 'wildcat' wells were drilled in British Columbia, 17 of which discovered gas and one of which discovered oil. The success discovery ratio continued to be the highest of any province. At the end of 1959 there were seven oil fields in British Columbia compared with six in 1958. The market for crude in this region was still local in 1959; consequently, production came mainly from the Boundary Lake and Fort St. John fields which are close to the refineries of the Peace River region.

Alberta.—Forty-two of the 350 exploratory wells drilled in Alberta in 1959 found oil and 45 found gas. The most concentrated exploratory drilling was in the Virginia Hills-Swan Hills-Judy Creek region, about 110 miles northwest of Edmonton. Following the initial discovery of crude oil at Virginia Hills in 1957, the Swan Hills field was found in 1958 about 25 miles to the northeast. In 1959 the Judy Creek field, about 14 miles south of Swan Hills, was discovered and, subsequently, about half-way between Judy Creek and Swan Hills, another discovery was made at Sarah Lake. Exploratory drilling has extended all of these areas. More recent discoveries give weight to a theory that the Swan Hills, Judy Creek and Sarah Lake fields may be part of a large single reservoir comparable in size to the huge Pembina field which has recoverable reserves of oil in the order of 1,000,000,000 bbl.

Development drilling continued to constitute the major portion of the drilling within the province, accounting for about 78 p.c. of all wells drilled. The most actively developed field was the Pembina field where 25 p.c. of all development wells were drilled. Second, was the Swan Hills field which accounted for almost 7 p.c., followed by the Keystone, Lobstick and Kaybob oil fields. Of the gas fields, the Medicine Hat, Hussar and Cessford fields were being most rapidly developed.

Saskatchewan.—Exploratory work declined significantly in Saskatchewan from the peak levels reached in 1957. In addition to declines in the geophysical and geological phases, exploratory drilling slumped from the high of 355 wells in 1957 to 222 in 1958 and 175 in 1959. The success ratio, which during the peak years in 1956 and 1957 was the highest in Canada, fell considerably. There were no significant new discoveries in 1959.

Development drilling in established fields in 1959 was at the same level as in 1958 when 581 development wells were drilled. About 17 p.c. of all development drilling was done in the Steelman field followed by Weyburn, Alameda, Carnduff, Queensdale and Midale, all in the southeast corner of the province.

Manitoba.—Exploratory drilling in Manitoba was largely unproductive in 1958 and 1959. In each year, 16 wells were drilled but only one well, drilled in 1958, was successful. No new fields have been discovered since 1957 when the Kirkella field was found. Development drilling in 1959 was at about half the level of 1958, when 76 wells were drilled.

Yukon and Northwest Territories.—One of the most significant oil strikes during 1959 was that made in the Yukon Territory at the Chance Number 1 well. This well is 325 miles northwest of the Norman Wells field, which is the only producing field in the Territories. The success in this virgin region has extended the boundaries of known oil resources in the Western Canada sedimentary basin to within 200 miles of the Arctic Coast. In all, five wells were drilled in the Territories in 1959 but four were dry holes.

Land holdings in the Territories amounted to 98,000,000 acres. In addition, 130,000,000 acres in the Arctic Islands were held by persons, pending revision of the Territorial Oil and Gas Regulations (see pp. 566-567).

Eastern Canada.—In Eastern Canada, exploration for oil and gas continued at close to the same rate as in 1958 but only in Ontario was the work successful. Four wells drilled in Prince Edward Island and New Brunswick during 1959 proved unproductive and the rig was moved to Cape Breton Island to test locations there. In Ontario the most noteworthy success was the offshore oil discovery near Colchester which was rated as one of the best discoveries ever made in this province. Natural gas discoveries in the Port Maitland area increased the provincial potential by about 5,000,000 cu. feet daily.

Petroleum Refining and Marketing.—No new refineries came on stream in 1959 but two were under construction and scheduled to come into operation by mid-1960. These bring the total number of operating refineries in Canada to 44 and cause some change in refining capacity distribution by raising the Maritime's portion to about 8 p.c. and Quebec's to about 32 p.c. During 1959 plant expansion and modernization increased crude oil capacity to 857,000 bbl. daily. In terms of crude throughput capacity, the Canadian industry ranks third in the world after the United States and the United Kingdom. The rate of growth of the refining industry is illustrated by the data in Table 2.

2.—Petroleum Refining Throughput Capacity, by Region, 1940, 1950 and 1959

Region	1940		1950		1959 ^a	
	bbl. per day	p.c.	bbl. per day	p.c.	bbl. per day	p.c.
Maritime Provinces.....	32,750	15.1	22,300	6.2	49,300	5.8
Quebec.....	64,500	29.6	143,000	39.8	264,800	30.9

Canada.....	217,270	100.0	358,875	100.0	857,207	100.0

The domestic market has always been the major outlet for Canadian crude oil, although the substantial markets in the United States in areas easily accessible to Canadian sources may assume a greater importance in the future. Refineries in Western Canada have, since 1955, used Canadian crude oil exclusively while plants in Ontario have been taking a greater share of their requirements from domestic sources. In 1959, Ontario met more than 97 p.c. of its demand from domestic sources. Ontario is now the major market for Western Canadian crude oil and in 1959 took almost 50 p.c. of the 150,000,000 bbl. of Canadian crude oil delivered to refineries within Canada. British Columbia refineries received over 22,000,000 bbl. and those in the Prairies over 54,000,000 bbl.

The progress made in the marketing of Canadian crude oil in Canada and the extent of the use of foreign crude oil are indicated in Table 3.

3.—Crude Oil Received at Canadian Refineries, by Region, 1940, 1950 and 1959

Region	1940		1950		1959

Canada.....	22,874	116,630	72,103	224,085	413,977	303,948

Exports of crude oil, all to the United States, were slightly higher in 1959 than in 1958 when 31,679,429 bbl. were exported. In 1959, pipeline deliveries to the United States amounted to 33,800,000 bbl., 13,296,000 bbl. of which were consigned to refineries located in the Puget Sound area of Washington and 20,504,000 bbl. to plants in the Great Lakes region.

Natural Gas Marketing.—Domestic markets as far east as Montreal were using Western Canada gas during 1959 and distribution companies were expanding their facilities to meet market requirements. By the end of 1959 approximately 100,000,000 cu. feet of Western Canada natural gas were being used daily in Ontario. This domestic gas, which first entered Eastern Canada in 1958, supplanted the large imports of gas made at Niagara and Windsor in Ontario.

Domestic sales of natural gas reached an estimated 280,000,000,000 cu. feet in 1959, equivalent to a 35-p.c. increase over 1958. Exports totalled 83,583,000,000 cu. feet. Domestic sales in 1959, by provinces on a percentage basis, were as follows: British Columbia 6.6 p.c., Alberta 48.9 p.c., Saskatchewan 10.8 p.c., Manitoba 2.9 p.c., Ontario 28.9 p.c. and Quebec 1.9 p.c.

The rapid build-up of reserves of natural gas in Alberta and British Columbia in recent years has attracted the attention of companies interested in supplying substantial markets in the United States. During 1959, the National Energy Board was set up by the Government of Canada with one of its prime responsibilities designated as the regulation of the movement of natural gas across interprovincial and international borders. The establishment and activities of the Board up to mid-1960 are outlined in Chapter XXI, Part IV, Section 2.

PRINCIPAL MINING LOCATIONS IN CANADA

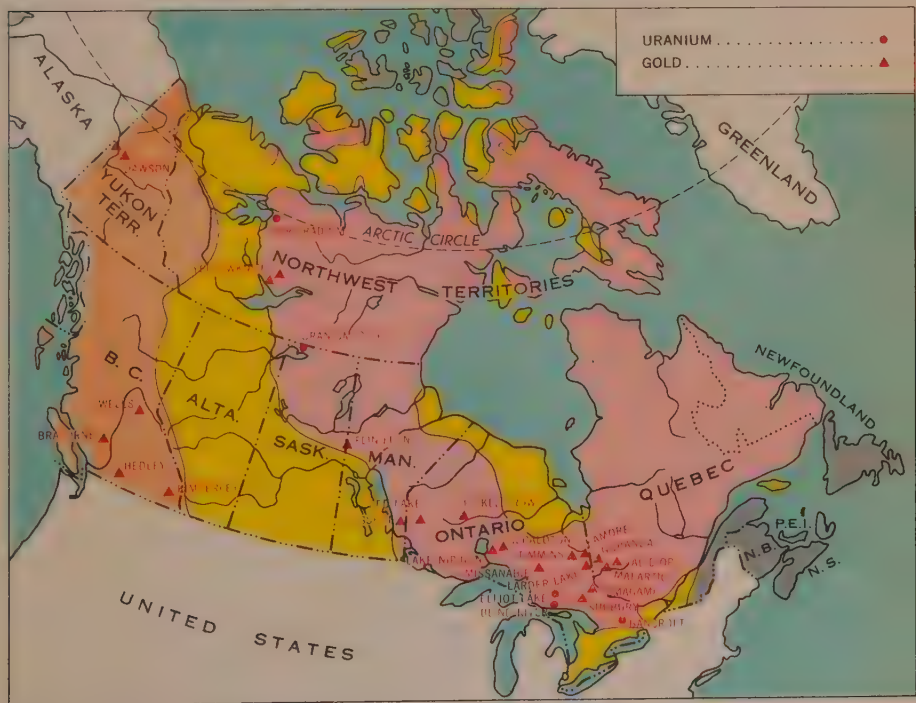

October, 1960

These maps show area locations only, without indication as to size or number of mines at such locations.

The names given are field names or those of nearby communities.

Subsection 4.—Coal

The continuing conversion to oil and gas by the railways, various industries and commercial and household consumers, aided to some extent by the general recession in 1958, resulted in further contraction of the Canadian coal industry.

In 1958 the industry suffered its greatest loss in eight years; production dropped to 11,687,110 tons, 11.4 p.c. from 1957 and 38.9 p.c. from the record of 19,139,112 tons in 1950. Production in 1958 was the lowest since 1912. Of the 1958 output, 66.3 p.c. was bituminous coal, 14.5 p.c. subbituminous and 19.3 p.c. lignite. Nova Scotia contributed about 45 p.c. of the total, Alberta 22 p.c., Saskatchewan 19 p.c., British Columbia and Yukon Territory over 7 p.c. and New Brunswick just under 7 p.c. Whereas Nova Scotia, New Brunswick, Alberta, British Columbia and Yukon Territory showed, collectively, a decrease of 14 p.c. compared with 1957, Alberta's change, the greatest in volume, amounted to a decrease of 20.2 p.c., bituminous coal accounting for 68 p.c. of this decrease. For the country as a whole, the production of bituminous coal decreased by about 15 p.c. and of subbituminous coal by about 11 p.c. Saskatchewan's output, consisting entirely of lignite, remained practically unchanged at 2,253,176 tons.

The apparent total consumption of coal in Canada amounted to 25,208,878 tons in 1958, a drop of 20 p.c. from 1957 and of 43.8 p.c. from 1950, the year of record production. Whereas in 1957 just over 60 p.c. of the coal consumed was imported, in 1958 the percentage was down to just over 56 p.c., of which about 89 p.c. was bituminous coal used in Central Canada. Some 4,000,000 tons, or almost 32 p.c. of the total bituminous coal imported, were used in the manufacture of metallurgical coke in Central Canada. Coal imports decreased by almost 26 p.c. from 1957, while the indigenous production decreased by about 11 p.c. Coal sales made by retail fuel dealers decreased 15 p.c. from 1957, railway coal decreased by over 58 p.c., and coal used for industrial purposes by 5.5 p.c. It may be noted that, as a result of dieselization, the annual consumption of coal used by railway locomotives decreased from 11,444,251 tons in 1949 to 1,393,823 in 1958. Whereas in the recent past the industrial coal market seemed to have levelled off, it now appears that this market is again yielding to liquid and gaseous fuels.

The consumption of briquettes, of which about 62 p.c. are made from bituminous coal, decreased sharply from 467,825 tons in 1957 to 239,770 tons in 1958. About 46 p.c. of the amount marketed (54 p.c. of the Canadian output) was used by railways in Western Canada mainly as locomotive fuel. However, the railway market for this type of fuel dropped from 287,000 tons in 1957 to 110,607 tons in 1958 and household and commercial consumption decreased from 180,825 tons to 129,163 tons.

Although the coal industry's economic position continues to be weakened, necessitating the closing down of mines in both Eastern and Western Canada, efforts are being made to improve its competitive position in the market by reducing costs of production, improving quality, and tailoring the types and grades of coal to suit varied consumer requirements. Mechanization of underground mining is progressing, especially in eastern collieries where most of the coal is mined mechanically. The Dosco ripper-type continuous mining machine is used in most of the mines of the Dominion Coal Company Limited on longwall faces. A newly developed machine equipped with a wedge and shearing bar is being used to increase the quantity of coarse coal. Dominion Coal also uses Joy ripper-type machines for development work, and a smaller company uses a similar type machine as well as two auger-type machines for room and pillar mining.

Strip mining, practised in all provinces except Nova Scotia where conditions are not suitable for such mining, also aids in reducing costs. Over 36 p.c. of Canada's 1958 output was produced by this method; the whole of Saskatchewan's lignite output was strip mined, 83.5 p.c. of New Brunswick's, almost 50 p.c. of Alberta's and 12.5 p.c. of British Columbia's. On an average the output per man-day in strip mining increased from 14.3 tons in 1957 to 15.3 tons in 1958, compared with a slight decrease from 2.89 tons to 2.87 for underground mining. The over-all output per man-day increased by over 2 p.c.

In an effort to produce better quality coals of greater versatility, the industry continues to direct attention to the use of modern methods of cleaning, drying, dust- and freeze-proofing, and briquetting. Additional facilities for cleaning and drying various sizes of coal, including fines, have been installed at several collieries in both Eastern and Western Canada.

Assistance is given to the coal industry by the Dominion Coal Board in the movement of coal to competitive markets (see p. 561). During 1958 coal moved under subvention was as follows: from Nova Scotia, 2,370,131 tons; from New Brunswick, 120,963 tons; from Saskatchewan, 297,892 tons; and from Alberta and British Columbia, 216,825 tons—39 p.c. of all the coal produced in Canada. The total was 6.7 p.c. lower than in 1957.

Details on coal in the respective coal-producing provinces follow.

Nova Scotia and New Brunswick.—Nova Scotia produces high volatile and medium volatile bituminous coking coals in the Sydney, Cumberland and Pictou areas and some non-coking bituminous coal in the St. Rose, Inverness and Port Hood areas (west coast of Cape Breton Island). Production in 1958 was 7.3 p.c. lower than in 1957, amounting to 5,269,879 tons valued at \$9.554 per ton f.o.b. mines. Many of the operations have been mechanized to cut costs and new equipment has been developed to reduce the quantity of slack coal produced. During the year about 13 p.c. of the coal mined in the province was mechanically cleaned.

New Brunswick's coal output comes entirely from a single thin seam (with an average thickness of 18 in.) of high volatile bituminous coal in the Minto area. Output decreased from 976,597 tons in 1957 to 790,719 tons in 1958 valued at \$8.374 per ton. The two cleaning plants established since 1955 allow for the beneficiation of over 34 p.c. of New Brunswick's production. Both plants are equipped with modern mechanical and thermal drying machines permitting the production of uniform quality products.

Much of the output of Nova Scotia and New Brunswick is used locally for industrial steam-raising for power production and processing, for household and commercial heating, and for the manufacture of metallurgical coke. In 1958 approximately 41 p.c. of the output was shipped to Central Canada for industrial, commercial and railway use. Of this, more than 95 p.c. originated in Nova Scotia.

Saskatchewan.—This province produces only lignite coal from the Bienfait and Roche Percee fields in the Souris area. Production amounted to 2,253,176 tons in 1958, approximately the same as in 1957, and was valued at \$1.944 per ton at the mine. On the average, this is the cheapest coal per million B.t.u. at 12.64 cents, as against 32.62 cents for all Canadian bituminous coals and 25.79 cents for all subbituminous coals. Slightly less than 52 p.c. of the 1958 output was shipped to Manitoba and about 10 p.c. to Ontario for industrial, commercial and household use.

The output of briquettes, which are made from carbonized lignite and used entirely for household and commercial purposes, increased slightly in 1958 to 41,142 tons.

Alberta.—Almost all types of coal are found in Alberta—semi-anthracite and low volatile bituminous coking coals in the Cascade area, and medium to high volatile bituminous coking coals in the Crowsnest and Mountain Park areas. Owing to the shrinking market, mining has been terminated in the Mountain Park area and has been seriously curtailed in the Crowsnest area. These mines mainly produced industrial steam and railway coals, but also supplied some commercial and household markets. Lower rank bituminous non-coking coals are produced in the Lethbridge and Coalspur areas and in several other areas of the Outer Foothills belt. The coals in the Drumheller, Edmonton, Brooks, Camrose, Castor, Carbon, Sheerness, Taber, Pembina and Ardley areas are subbituminous and those in the Tofield, Redcliff and several other areas are on the border of subbituminous and lignite. All these lower rank coals are mainly household and commercial coals, but increasing amounts are being used industrially, especially for thermal power production. The strip-mined coals, valued f.o.b. mines at a weighted average of \$2.921 per ton as against a weighted average value of \$7.101 per ton for underground-mined coal, are mainly used for power production.

Production declined in the province from 3,156,546 tons in 1957 to 2,519,901 tons in 1958. Since the discovery of the Leduc oil field in 1947 and the subsequent expansion of the natural gas industry, coal output has dropped by almost 71 p.c. About 67 p.c. of the 1958 Alberta output was subbituminous. The production of bituminous coal decreased by 34.2 p.c. to 834,256 tons, whereas that of subbituminous decreased by only 10.8 p.c. The average value of bituminous coal f.o.b. mines was \$6.326 per ton and subbituminous \$4.467, both slightly lower than in 1957.

The output of briquettes, which are made from the semi-anthracite and low volatile bituminous coals of the Cascade area and the medium volatile bituminous coals of the Crowsnest area, continued downward, dropping from 269,147 tons in 1957 to 128,502 tons in 1958. Of the total manufactured, about 38.5 p.c. was made in the Cascade area.

Of the total production of all the coals mined in Alberta, about 9 p.c., consisting to a large extent (79 p.c.) of subbituminous coal, was shipped to Manitoba, 23.2 p.c. to Saskatchewan and 21.2 p.c. to British Columbia for both industrial steam-raising and household use. Only about 2.1 p.c. was shipped to Central Canada to be used mainly for commercial purposes.

British Columbia.—Bituminous coking coal, ranging from high to low volatile, is mined on Vancouver Island and in the East Kootenay (Crowsnest), Telkwa and Nicole (Merritt) areas. Small quantities of subbituminous coal are produced in the Princeton field. Mining on Vancouver Island was confined almost entirely to one mine in the Comox area. Production in British Columbia in 1958 amounted to 849,091 tons compared with 1,113,699 tons in 1957. The 1958 total included 4,344 tons and the 1957 total 7,731 tons mined in the Yukon Territory. Of the total, about 80 p.c. was produced in the Crowsnest area. The average value of British Columbia bituminous coal was \$6.160 per ton for the Crowsnest area and \$8.846 per ton for Vancouver Island. Of the total production about 17.5 p.c. was shipped to Manitoba and 7.6 p.c. to Ontario.

Medium temperature oven (by-product) coke for industrial consumption in Western Canada and northwestern United States is manufactured in the Crowsnest area, somewhat under 200,000 tons being produced in 1957. The single briquetting plant in the province, which is located in the Crowsnest area, produced 34,396 tons (about 85 p.c. railway fuel) in 1958 as against over 84,000 tons in 1957. Approximately 8 p.c. of the provincial output of coal, which was coking coal from the Crowsnest area, was exported to southwestern United States for blending in the manufacture of metallurgical coke.

Section 2.—Government Aid to the Mineral Industry

Subsection 1.—Federal Government Aid

The Department of Mines and Technical Surveys.*—The federal Department of Mines and Technical Surveys came into being on Jan. 20, 1950, in the reorganization of the former Department of Mines and Resources. The Department has five branches—Surveys and Mapping Branch, Geological Survey of Canada, Mines Branch, Dominion Observatories, and Geographical Branch. The Department's functions include the administration of the Emergency Gold Mining Assistance Act and of the Explosives Act.

Surveys and Mapping Branch.—The Branch provides the base maps required for use in the development of Canada's natural resources, produces and distributes many Canadian aids to navigation, is responsible for legal surveys of federal lands and provides a national system of levelling and precision surveys for use as geodetic control by federal, provincial and private agencies.

The Geodetic Survey provides the original surveys that form the framework or basic control for mapping throughout Canada and for engineering and surveying projects related to natural resources development. Survey stations are established at fairly

* Revised, under the direction of the Deputy Minister, in the Editorial and Information Division, Department of Mines and Technical Surveys, Ottawa.

regular intervals across Canada and are marked by permanent monuments whose latitudes, longitudes and elevations above mean sea level are determined with a high degree of accuracy.

The Topographical Survey provides topographical maps that show all significant natural and artificial features fundamental to the study and economic development of mineral and other natural resources. The Field Survey Section is responsible for the field surveys that provide ground control for mapping from aerial photographs, and the Air Surveys Section plots and produces maps from these aerial photographs. The National Air Photographic Library indexes, preserves and distributes prints of all aerial photography done by or for the Federal Government. The Topographical Survey also administers the Canadian Board on Geographical Names.

The Legal Surveys and Aeronautical Charts Division makes and records legal surveys of federal Crown lands in the Yukon and Northwest Territories, the National Parks and Indian lands and reserves. This Division prepares aeronautical charts and electoral maps and prepares and distributes flight manuals.

The Canadian Hydrographic Service is responsible for the charting of the coastal and inland navigable waters of Canada, the analyses of tides and tidal current phenomena and the investigation of water-surface elevations of the St. Lawrence-Great Lakes waterway. The resultant data are published in the form of official navigation charts, volumes of Sailing Directions, Tide Tables and Water Level Bulletins.

The Map Compilation and Reproduction Division prepares, drafts and reproduces maps, charts and plans for lithographic printing in multicolour. The work includes the preparation and photo-reproduction of air chart bases, the reproduction and printing of air information for aeronautical charts, the preparation and printing of topographic maps and the reproduction and printing of hydrographic charts.

*Geological Survey of Canada.**—The primary function of the Geological Survey is to obtain information on the geology of Canada that will be of assistance in the search for and development of mineral deposits. The results of its activities also provide a basis for the appraisal and conservation of Canada's mineral resources generally, including water supplies, for soil surveys, and for the solution of geological problems that frequently arise in construction projects. Reports issued by the Geological Survey include: memoirs with fairly complete descriptive accounts of the geology of particular areas, usually accompanied by geological maps; bulletins dealing with problems rather than areas; papers issued as soon as possible after the close of the field season, treating separately of each area and summarizing the information acquired; and the Economic Geology Series dealing in a comprehensive way with mineral deposits of a particular type. Information circulars, issued in advance of the more detailed reports, contain data of immediate interest to prospectors. Coloured geological maps are issued on various scales from one inch equalling a few hundred feet to one inch equalling eight or more miles, the common standard scales being one inch to one mile and one inch to four miles. Preliminary maps showing the geology are issued shortly after the field season ends for those areas where the search for metals or minerals is active. Metallogenic maps show the Canada-wide distribution of known occurrences of particular metals classified according to the type of deposit.

The Regional Geology Division is responsible for mapping and studying the rocks of the eastern and western segments of the Precambrian shield, and the Appalachian and Cordilleran regions.

The Economic Geology Division investigates the geology of specific mineral deposits, applies and develops geochemical techniques, and maps and studies unconsolidated deposits that mantle much of the country and, in several provinces, carries out surveys of groundwater resources.

* A special article covering the history and current activities of the Geological Survey of Canada appears at pp. 13-19.

The Fuels and Stratigraphic Geology Division includes stratigraphic palaeontology, the geology of fuels (oil, natural gas and coal), subsurface geology, and research on coal. Its function is to establish the character, age, thickness and correlation of both exposed and concealed sedimentary formations and to map the distribution and structure of these formations with the object of determining the economic possibilities of prospective oil, gas and coal bearing areas of Canada.

The Petrological Sciences Division makes mineralogical, petrological, and isotopic studies of Canadian mineral deposits and associated rocks. Laboratories provide mineral identifications for the public, supply officers of the Survey with mineralogical and geochronological data, and permit research on the genesis of ores, fuels and rocks. Systematic mineral collections are maintained and mineral and rock collections are prepared for use by prospectors and educational institutions.

The Geophysics Division gathers, compiles and interprets geophysical data relating to the geology of Canada. Fundamental research is carried out in some phases of geophysical work.

Mines Branch.—Investigations undertaken in Branch laboratories cover a wide range of technical projects of importance to the advance of fundamental research; to the processing of ores, industrial minerals and fuels on a commercial scale; and to the theory and practice of physical metallurgy.

The Mineral Processing Division is concerned primarily with the development of economical methods of mineral dressing and with research toward the improvement of present processing techniques. It is equipped to conduct laboratory and pilot-plant studies involving a variety of procedures: crushing, grinding, gravity concentration, sink and float (heavy media) separation, magnetic and electrostatic concentration, amalgamation, cyanidation, flotation and roasting. Tests are conducted on both metallic and non-metallic minerals.

The Extraction Metallurgy Division seeks the development of better hydrometallurgical and pyrometallurgical processes for the treatment of ores and the solution to specific technical problems in this field. A substantial part of its efforts was recently devoted to ores of uranium, iron and other elements and to corrosion problems encountered in certain industrial and governmental projects. The Division accepts samples from operating mines or those under development.

The Mineral Sciences Division applies the principles of chemistry and physics to fundamental and long-term problems in the field of mineral technology and related aspects of metallurgy. It deals with ores, mineral and metal products, inorganic crystalline materials and radioactive substances. Its work ranges from relatively simple routine determinations to complex research problems requiring the most recent techniques and equipment.

The Fuels and Mining Practice Division studies the properties of fossil fuels in Canada to determine the most efficient means of utilizing fuel resources. Most of the work on coal is directed to investigations on the immediate problems of the industry and to engineering studies on the most efficient use of coal in combustion applications with particular reference to thermally generated electric power. Such investigations include work on the evaluation of cleaning performance and the beneficiation of coal fines that are difficult to market, the uses of coal in the metallurgical industries and the study of stress phenomena in mining. Research in petroleum is directed mainly to problems in the refining of heavy crudes and high-sulphur bitumens, and to the chemical evaluation of oils and bituminous substances for classification and genetic purposes.

The Physical Metallurgy Division aids the metal industries through the development of new alloys, new manufacturing techniques and new applications and in activities aimed toward improving present practices in metal fabrication. It also conducts fundamental research on the properties and behaviour of metals. The Division serves the Department of National Defence by extensive research and investigative work, concerned broadly

with the development of defence materials and prototype equipment and with the metallurgical problems of that Department. It is also operative in the nuclear metallurgy field.

Dominion Observatories.—The two main units of the Dominion Observatories are the Dominion Observatory at Ottawa, Ont., and the Dominion Astrophysical Observatory at Victoria, B.C. Permanent magnetic observatories are maintained at Ottawa and Agincourt, Ont., Meanook, Alta., Victoria, B.C., and at Resolute Bay and Baker Lake, N.W.T. Seismic stations for recording earthquakes are operated at Victoria, Horseshoe Bay and Alberni, B.C., Banff, Alta., Saskatoon, Sask., Ottawa, Ont., Seven Falls and Shawinigan Falls, Que., Halifax, N.S. and Resolute, N.W.T.

The Dominion Observatory at Ottawa is responsible for the time service of Canada which involves nightly astronomical observations of star positions and radio broadcast services for distributing accurate time to all parts of Canada. Other astronomical activities centred at Ottawa include upper atmospheric studies by means of meteor observations, studies of the sun and its effect on earthly conditions and mathematical studies of the atmospheres of the sun and stars. The geophysical work, also administered from Ottawa, includes the magnetic survey of Canada with emphasis on aids to air and sea navigation, as well as field and observatory work of interest to the geophysical prospector. The methods of seismology are employed to study important aspects of the earth's crust in Canada and to assist in world-wide investigations of the earth's interior. Gravity observations are carried on throughout Canada with a generally similar purpose, special attention being paid to methods of locating mineral deposits.

The Dominion Astrophysical Observatory at Victoria, B.C., is devoted to fundamental research into the physical characteristics of the sun, stars, planets and the material of interstellar space. Its 73-inch reflecting telescope is one of the largest in the world and through its use many important contributions have been made to astronomical knowledge. A new radio telescope at Penticton, B.C., has given the Branch a valuable instrument for research in radio astronomy.

The Geographical Branch.—The function of the Branch is to organize and make available all the geographical data on Canada that might be of use in promoting the country's economic, commercial and social welfare. The work is of two kinds—the compilation of geographical material of national significance, and geographical surveys in the field. Land surface conditions, types of vegetation and the structure of towns and cities are typical subjects of investigation.

Mineral Resources Division.—The Division provides a mineral information service that is freely used by government departments, mining and allied industries and others interested in mining or its significance in the Canadian economy. A mineral resources index inventory is maintained of all known occurrences and of mines, both active and potential. The Division makes economic studies of different phases of the mining industry. It administers the Emergency Gold Mining Assistance Act, prepares reports on request to aid in the administration of such matters as tax exemptions on new mining properties, and prepares reports and briefs on general legislation, taxation and tariff matters connected with the mineral industry. The Division is widely known for its publications among the most valuable of which are the annual reviews of production, marketing and other matters concerning 64 minerals. It issues more detailed economic studies of metals and fuels of current interest and prepares annual lists of metallurgical works, metal and industrial mineral mines, milling plants, coal mines and petroleum refineries. Also published are special monographs on mining laws, taxation and subjects of particular interest to the mineral industry.

Oceanography.—The decision of the Federal Government to expand oceanography in the Department of Mines and Technical Surveys has led to the institution of a long-range program of research to fill the great need for oceanographic data on the country's coastal waters for defence and resource development purposes.

The program comprises: (1) The establishment on the East Coast, in the Bedford Basin near Halifax, of the Bedford Institute of Oceanography. This is a \$3,000,000 project which should be completed by 1964. When in operation, it will have a staff of some 300 scientific personnel and supporting staff. The Institute will have the facilities for study in all phases of oceanography and an operating fleet of 10 oceanographic vessels. A multi-million dollar shipbuilding program is planned to provide the fleet; the first vessel, the \$7,000,000 CGS *Hudson*, is expected to be commissioned in 1961. (2) The Polar Continental Shelf Project, in which the Department will send each year a scientific expedition into the Arctic wastes north of the Canadian Archipelago to carry out a broad program of research on its Continental Shelf in the Arctic Ocean. The initial expedition in 1959 was reconnaissance in nature. Starting in 1960, the research teams manning the expeditions will begin intensive research on the Shelf; study and map the topography of the ocean floor; measure the movements, temperature and chemical properties of the water at various depths; study the geology of the Shelf's floor and compare it with that of the adjoining land, and study the structures underlying the floor.

The Dominion Coal Board.*—The Board was established by the Dominion Coal Board Act (RSC 1952, c. 86) which was proclaimed on Oct. 21, 1947. By this Act the Board was constituted a department of government to advise on all matters relating to the production, importation, distribution and use of coal in Canada. The Board is also charged with the responsibility of advising upon and administering transportation subventions.

Ancillary to these principal duties, the Board is empowered to undertake research and investigations with respect to:—

- (1) the systems and methods of mining coal;
- (2) the problems and techniques of marketing and distributing coal;
- (3) the physical and chemical characteristics of coal produced in Canada with a view to developing new uses therefor;
- (4) the position of coal in relation to other forms of fuel or energy available for use in Canada;
- (5) the cost of production and distribution of coal and the accounting methods adopted or used by persons dealing in coal;
- (6) the co-ordination of the activities of government departments relating to coal; and
- (7) such other matters as the Minister may request or as the Board may deem necessary for carrying out any of the provisions or purposes of the Act.

In addition, the Dominion Coal Board Act provides authority in the event of a national fuel emergency to ensure that adequate supplies of fuel are made available to meet Canadian requirements.

Assistance by transportation subventions, which have been maintained in varying degrees during the past 30 years, was designed to further the movement of Canadian coals by equalizing as far as possible the laid down costs of Canadian coals with imported coals. As these costs and the conditions of the coal industry are subject to variation, the Board must review from time to time the rates of subvention and the areas where the assistance is required. The subventions in respect of the various Canadian coals are authorized by Orders in Council and are paid from moneys voted by Parliament for the purpose from year to year. During the year ended Mar. 31, 1959, a total of 2,729,552 tons was shipped under subvention and \$9,186,021 was paid in assistance.

Coal subventions of a new type, based on the B.t.u. content of coal used in thermal electric power production, were authorized in January 1958 by the Atlantic Provinces Power Development Act (SC 1958, c. 25). The Dominion Coal Board was designated as the Federal Government's administrative agency for subvention matters in agreements made with the provinces under this Act.

As agent to the Minister of Mines and Technical Surveys, the Board receives applications and administers loans under the Coal Production Assistance Act (RSC 1952, c. 173, as amended by SC 1958, c. 36, and SC 1959, c. 39). The Board also administers payments under the Canadian Coal Equality Act (RSC 1952, c. 34), which provides a subsidy on

* Prepared under the direction of W. E. Uren, O.B.E., Chairman of the Dominion Coal Board.

Canadian coal used in the manufacture of coke for metallurgical purposes. In the year ended Mar. 31, 1959, payments under this Act totalling \$266,647 were made on 538,680 tons of coal.

The Dominion Coal Board has maintained a continuous review of Canada's fuel requirements. In view of the growing impact of oil and natural gas on the markets for Canadian coal, the Board and its staff have intensified the study of the relation of the competing sources of energy and of possible new outlets for the solid fuel.

The Board, since its inception, has worked toward the co-ordination of the activities of various government departments and other bodies relating to coal. On the matter of technical research as related to marketing and distributing coal, the Board has maintained close liaison with the Fuels and Mining Practice Division of the Department of Mines and Technical Surveys. Dominion-provincial conferences on coal research have been held annually since 1949 for the purpose of co-ordination and exchange of ideas.

Government purchases of fuel which constitute an important outlet for coal have claimed a part of the Board's time. The Interdepartmental Committee on Fuel, set up in the past to co-ordinate and advise on the purchase and supply of fuel to the Armed Services, has remained active. The Dominion Fuel Committee, which was organized in 1956 along similar lines as an advisory body to other government departments, has demonstrated its value.

In a wider sphere, the Chairman of the Board has met annually with the Coal Policy Committee of the Provincial Ministers of Mines and the Board has given consideration to recommendations made by the latter body relating to coal. The Board has also kept contact with trade and other associations concerned with the various phases of the Canadian coal industry in order to foster better mutual understanding of government and private endeavour. It has generally constituted a central agency through which representations may be made to the Government.

Pursuant to the recommendations of the Royal Commission on Coal (1946), the Board has continued to work for a reduction of customs duties and sales tax on coal mining machinery. It has also maintained its efforts to create a uniform system of coal mine cost accounting which would provide an accurate presentation of the cost of production.

The Dominion Coal Board consists of seven members including the Chairman who is its Chief Executive Officer and has the status of a deputy minister. The Board is responsible to, and subject to the direction of, the Minister of Mines and Technical Surveys.

Subsection 2.—Provincial Government Aid*

Newfoundland.—The Newfoundland Government, through its Mines Branch, provides several valuable services to those interested in prospecting and mining. It supplies certain geological maps of specific areas to interested parties. It identifies specimens sent in from Newfoundland and Labrador and assays by chemical means those that appear to have some mineral content. If good specimens from a known area warrant further investigation, a geologist from the Department of Mines and Resources is available to visit the locality and give advice. Prospecting and mining permits are issued by the Department and claims are registered.

Nova Scotia.—Under the provisions of the Mines Act (RSNS 1954, c. 179), the Government of Nova Scotia may assist a mining company or operator in the sinking of shafts, slopes, deeps and winzes and the driving of adits, tunnels, crosscuts, raises and levels. This assistance may take the form of work performed under contract, the payment of bills for materials and labour or the guarantee of bank loans. Any such work must be approved by the Department of Mines. The Government is also authorized to assist the mining industry to procure power on the most economical basis and may guarantee the Nova Scotia Power Commission against any loss of revenue incurred on account of capital investments made for that purpose. Mining machinery and equipment that may be

* Compiled from material supplied by the respective provincial governments.

used in searching for or testing and mining minerals may be made available through the government. Such equipment is under the direct supervision of the Chief Mining Engineer.

The Government of Nova Scotia is also empowered to make any regulations considered necessary for increasing the output of coal. Such regulations cover the appropriation, on payment, of unworked coal lands, the operation of coal mines, and loans or guarantees for loans. Close co-operation is maintained with the Federal Government in carrying out federal regulations made to secure increased production and economical distribution of coal from the mines of the province.

New Brunswick.—There are five divisions under the Mines Branch of the Department of Lands and Mines. The *Mineral Lands Division* administers the disposition of Crown mineral rights including the issuing of prospecting licences, recording of mining claims, issuing of mining licences and leases and other matters pertaining thereto. Detailed and index claim maps are prepared for distribution. The *Mine Inspection and Engineering Division* administers the safety regulations governing operations under the Mining Act. Regular inspections of all mines are performed. Laboratory facilities are maintained. It is the responsibility of this Division to approve equipment used in mines. The *Geological Division* carries on general and detailed geological mapping and investigation. Maps and reports are prepared for distribution. Mineral and rock specimens are examined for prospectors. Preliminary examinations of mineral prospects are performed where requested and circumstances warrant. The *Mine Assessment Division* is responsible for collection of mining tax and royalties and preparation of statistics concerning mineral production. The *Bathurst Division* serves as recording office for northeastern New Brunswick. In addition, claim maps as well as topographical, geological and aeromagnetic maps are available for perusal and distribution. The staff is prepared to provide information concerning the Mining Act and the use of various types of maps.

Quebec.—The Mining Act (RSQ 1941, c. 196) authorizes the Quebec Department of Mines to build, maintain and improve roads needed for mining development. Such work is done by contract under the supervision of departmental engineers. The Act gives the Department considerable latitude in this respect. Certain major roads have been built to new mining districts and completely paid for; on the other hand, if a particular property requires a branch road from an established highway the owner may be required to contribute a portion of the cost. To prevent the development of uncontrolled settlements in the vicinity of operating mines the Department regulates the use of land and permits the establishment of well organized communities. The municipal organization of such communities is administered by the Department of Municipal Affairs.

The Department maintains well equipped laboratories for the benefit of prospectors, geologists, engineers and mine operators. The facilities include equipment for mineralogy, petrography, ore dressing, and analysis by wet or dry assay, spectrography or X-ray. Qualitative and mineralogical determinations are made free of charge but quantitative analyses are charged for, according to a tariff schedule. The Mining Act provides free coupons to be used by prospectors in paying for such analyses.

The province has authorized the establishment of research laboratories to assist mining and metallurgical enterprises in the processes and techniques of extracting, transforming and utilizing ores.

The Department undertakes geological mapping and inspection. The work is divided between two branches, one responsible for reconnaissance (areal) mapping, and the other doing detailed mapping in mining districts and inspection of individual deposits or properties. Field parties are headed by geologists or mining engineers. The published reports on these investigations are distributed free upon request. During the field season about 35 parties are maintained in different sections of the province. Offices, in charge of resident

geologists, are maintained in mining districts to collect, preserve and compile geological information disclosed by mining explorations and individual sheets of the compilations are made available to the public.

The Department employs inspectors whose duties are concerned almost exclusively with the safety of workmen in operating mines. Three Mobile Mine Rescue Stations are operated and a mine rescue training program is conducted throughout the province.

In the field of education for prospectors, five-week courses are organized each year at Laval and Montreal Universities. University scholarships are granted each year to deserving undergraduate and postgraduate students in mining, geology and metallurgy, thus contributing to the training of qualified engineers for the benefit of the mining industry. Lectures are given to prospectors at different localities throughout the province.

Ontario.—The Ontario Department of Mines renders a multiplicity of services of direct assistance to the mining industry within the province, as briefly outlined below.

Mining Lands Branch.—This Branch handles all matters dealing with the recording of mining claims, assessment work, etc., and the final issuance of title to mining lands. As a service to the mining public, individual township maps are prepared and kept up to date showing lands open for staking and recorded and patented claims therein. As new surveys are made or later data become available, maps are revised in keeping with such information. District Mining Recorders maintain offices at strategic locations throughout the province.

Geological Branch.—A continuing program of geological mapping and investigation is carried out by the geological staff of the Department. Detailed reports and geological maps of the areas studied are made available to the public. In many of the active areas of the province resident geologists are engaged to gather and make available to the public information concerning geological conditions, exploration and development within their respective districts. One geologist specializing in industrial minerals is maintained on the staff to examine deposits of this type, to investigate methods of treatment and recovery of such minerals and to compile data on the uses, specifications and markets for such products. Collection and dissemination of information on groundwater resources is also a function of the Geological Branch. During the winter months, courses of instruction for prospectors are held in various centres throughout the province.

Laboratories Branch.—The Provincial Assay Office located in the East Block of the Parliament Buildings, Toronto, carries out wet analyses and assays of metal and rock constituents on a custom fee basis and also renders the same service free of charge to holders of valid assay coupons issued for the performance of assessment work on mining claims. The Timiskaming Testing Laboratories situated at Cobalt, in addition to performing fire assays and chemical analyses, conducts a bulk sampling plant mainly to assist the producers of the area in the marketing of the cobalt-silver ores. A Cable Testing Laboratory, wherein all hoisting ropes in use at the mines are periodically tested, is operated under the supervision of the Inspection Branch.

Inspection Branch.—The main function of this Branch is the regular examination of all operating mines, quarries, sand and gravel pits and certain metallurgical works with a view to ensuring proper conditions of health and safety to the men employed. District offices to serve the local areas are maintained in the major mining centres of the province. Mine rescue stations in the principal mining sections are operated under the supervision of the Inspection Branch.

Exhibitions.—The Department each year presents displays pertaining to mining within the province at such exhibitions as the Canadian National at Toronto and at other centres from time to time.

Publications Branch.—All maps and reports of the Department are distributed through the agency of the Publications Branch located at the main office of the Department.

Library.—A mining library for the use of the Department and the public is maintained within the Department. This library stocks mainly publications and maps issued by the federal and provincial governments of Canada as well as numerous periodicals and bulletins from the United States.

Mining and Access Roads.—In 1951 the Department of Mines undertook a program of road construction in the mineralized areas of the province, to open them for prospecting and development and to facilitate the actual operation of mining enterprises. When the importance of this program in its relation to the whole development of northern Ontario became apparent, the Government decided that its scope should be widened and, with that end in view, an interdepartmental committee was set up early in 1955 to decide on matters of policy and to determine the locations and priorities of the proposed roads. The Minister of Mines sits on this committee with the Ministers of Lands and Forests, of Treasury, and of Highways.

The Department of Highways supervises the construction of all access roads. Certain roads may be subsidized while others may be financed solely by Department of Mines funds. The sum of \$1,500,000 a year has been made available for these projects.

Manitoba.—The Mines Branch of the Manitoba Department of Mines and Natural Resources offers five main services of assistance to the mining industry: maintenance, by the Mining Recorder's offices at Winnipeg and The Pas, of all records essential to the granting and retention of titles to every mineral location in Manitoba; compilation, by the geological staff of the Branch, of historical and current information pertinent to mineral occurrences of interest and expansion of this information by a continuing program of geological mapping; enforcement of mine safety regulations and, by collaboration with industry, introduction of new practices such as those concerned with mine ventilation and the training of mine rescue crews which contribute to the health and welfare of mine workers; and maintenance of a chemical and assay laboratory to assist the prospector and the professional man in the classification of rocks and minerals and the evaluation of mineral occurrences.

Manitoba also aids the mining industry by the construction of access roads to mining districts.

Saskatchewan.—Assistance to the mining industry in Saskatchewan is administered by the Mines Branch, Department of Mineral Resources, with its head office at Regina. This Branch is headed by a Director and comprises three divisions.

The Geology Division is directed by the Chief Geologist, and maintains resident geologists in or near the principal mining areas. The Division conducts a prospectors' school which gives basic training in geology, mineralogy, prospecting and exploration techniques and administers the Prospectors' Assistance Plan which assists by lending equipment, paying certain transportation costs, paying for a grub-stake, and by providing technical advice. During the summer months, geological crews survey and map areas and prepare reports which are made available to the public. In 1957 and 1958 magnetometer and electro-magnetic surveys were conducted on approximately 3,000 sq. miles of the Precambrian area.

The Engineering Division administers the Mines Regulation Act, the purpose of which is to ensure safe working conditions in mines. Inspections of mines are carried out by division officers, a Chief Engineer of Mines stationed at Regina, and an Inspector of Mines stationed at Uranium City. Safety education is also part of the Division's work, taking the form of first aid instruction, mine rescue training, and analysis of accidents.

The Mining Lands Division is responsible for making disposition of all Crown minerals with the exception of petroleum and natural gas, and maintains records respecting areas let out by lease, permit or claim. Recording offices, having the responsibility of assisting the public in determining the lands available and accepting applications, are located at Regina, Prince Albert, La Ronge, Uranium City and Flin Flon.

Alberta.—Alberta Government assistance to the mining industry is diversified in character. The Mines Division of the Department of Mines and Minerals regulates coal mines and quarries and maintains standards of safety by inspection and certification of workers. The Workmen's Compensation Board also maintains safety standards and trains mine rescue crews. The oil and gas industries are served in a similar way by the Oil and Gas Conservation Board. Its regulatory measures, however, are also concerned with preventing the waste of oil and gas resources and with giving each owner of oil and gas rights the opportunity of obtaining a fair share of production. This Board compiles periodic reports and annual records which are of invaluable assistance in oil development in Alberta. The mining industry is also served by the Research Council of Alberta which has made geological surveys of most of the province and has carried forward projects concerned with the uses and development of minerals. The Council has studied the occurrence, uses and analyses of Alberta coals and their particular chemical and physical properties, the use of coals in the generation of power, the upgrading and the cleaning of coal and has also studied briquetting, blending, abrasion loss, shatter and crushing strength, asphalt binders and dust-proofing of coal. Studies have been made of glass sands, salt, fertilizers, cement manufacture and brick and tile manufacture.

The province from time to time has had commissions examine various aspects of the mining industry when it has considered that their findings would be of assistance in developing such industries. The province, together with the Canadian Association of Oil Well Drilling Contractors and the Western Canada Petroleum Association, maintains a detailed supervisory and safety training program concerned with the drilling of oil and gas wells. Of assistance also to mining companies and oil companies are the special deductions provided for in the Alberta Corporation Income Tax Act. These follow the parallel provisions in the federal Income Tax Act.

British Columbia.—The Department of Mines of British Columbia provides the following services: detailed geological mapping as a supplement to the work of the Geological Survey of Canada; free assaying and analytical work for prospectors registered with the Department; assistance to the prospector in the field by departmental engineers and geologists; grub-stakes, limited to a maximum of \$500, for prospectors; assistance in the construction of mining roads and trails; and inspection of mines to ensure safe operating conditions.

Section 3.—Mining Legislation

Federal Mining Laws and Regulations.*—The Federal Government administers mining laws in the Yukon and Northwest Territories, as well as those within Indian reserves.

Mining Acts and Regulations applicable to the Territories are administered by the Resources Division of the Northern Administration Branch, Department of Northern Affairs and National Resources. Minerals underlying federal land under grant are reserved to the Crown and mining rights may be acquired by staking mineral claims under the appropriate Act or Regulations. Twenty-one-year leases of claims may be issued and these leases are renewable.

The disposal of minerals underlying an Indian reserve is subject to the consent of the Indians occupying the reserve and to treaties relating thereto.

Early in 1960, changes in oil and gas regulations opened new areas to development and guaranteed to Canadians an opportunity to benefit financially in such development. In the past, the Territorial Oil and Gas Regulations applied only to the Northwest Territories

* The Acts and Regulations governing mining and quarrying on federal lands are summarized in Report No. 854, entitled *Digest of the Mining Laws of Canada*, issued by the Mines Branch, Department of Mines and Technical Surveys, Ottawa. Copies of individual Acts and Regulations may be obtained from the Resources Division, Northern Administration Branch, Department of Northern Affairs and National Resources, Ottawa. Also of interest in connection with mining regulations is a publication entitled *Summary Review of Federal Taxation and Certain Other Federal Legislation Affecting Mining, Oil and Natural Gas Enterprises in Canada*, obtainable from the Department of Mines and Technical Surveys.

and Yukon Territory; the revised legislation includes provision for the exploration and development of lands underlying the territorial waters of Canada wherever these are within federal jurisdiction.

The regulations remain largely the same in detail but two important new clauses concerning Canadian participation in financing and ownership are added at the lease stage: (1) no lease will be granted to an individual unless the Minister of Northern Affairs and National Resources is satisfied that the lessee is a Canadian citizen and will be the beneficial owner of the interest that will be granted; and (2) as far as companies are concerned, the regulations require that oil companies, to obtain a lease, must be incorporated in Canada and must make their shares available to Canadians by listing on recognized Canadian stock exchanges or show that Canadian citizens are the beneficial owners of at least half the issued equity stock.

The extra time and cost involved in Arctic exploration and development are recognized by other new provisions that apply to the Far North, including the extension of the life of exploration permits from nine to twelve years and the doubling in size of permit areas.

Provincial Mining Laws and Regulations.*—All Crown mineral lands lying within the boundaries of the several provinces (with the exception of those within Indian reserves and National Parks which are under the jurisdiction of the Federal Government) are administered by the respective provincial governments.

The granting of land in any province except Ontario and Nova Scotia no longer carries with it mining rights upon or under such land. In Ontario mineral rights are expressly reserved if they are not to be included. In Nova Scotia all minerals belong to the Crown except limestone, gypsum and building materials and, in granting land from the Crown, the right to these minerals goes with the title. In Newfoundland mineral and quarry rights are expressly reserved. Some early grants in British Columbia, Alberta, Saskatchewan, Manitoba, New Brunswick, Quebec and Newfoundland also included certain mineral rights. Otherwise mining rights must be separately obtained by lease or grant from the provincial authority administering the mining laws and regulations. Mining activities may be classified as placer, general minerals (or veined minerals and bedded minerals), fuels (coal, petroleum, gas) and quarrying. Provincial mining regulations under these divisions are summarized in the following paragraphs.

Placer.—In most provinces in which placer deposits occur there are regulations defining the size of placer holdings, the terms under which they may be acquired and held, and the royalties to be paid.

General Minerals.—These minerals are sometimes described as quartz, lode, or minerals in place. With the exception of British Columbia the most elaborate laws and regulations apply in this division. In all provinces except Alberta a prospector's or miner's licence, valid for one year, must be obtained to search for mineral deposits, the licence being general in some areas but limited in others. A claim of promising ground of a specified size may then be staked. This claim must be recorded within a time limit and payment of recording fees made except in Quebec where no fees are required. Work to a specified value per annum must be performed upon the claim for a period of up to ten years. There is no time limit in British Columbia but \$500 assessment work, of which a survey may represent two-fifths, must be performed and recorded before a lease may be obtained. In Quebec a specified number of man-days of work must be performed and the excess may be carried forward for renewals of licence; before mining can be commenced a mining concession must be purchased for which it is necessary to produce an engineer's report indicating the presence of an orebody. The taxation applied most frequently is a percentage of net profits of producing mines or royalties. In the Province of Newfoundland the provincial mining tax has been modified since Confederation on Mar. 31, 1949 to conform with the provincial obligations under the Dominion-Provincial Tax Agreement. No other form of taxation or royalty now exists.

* Compiled from material supplied by the provincial governments.

Fuels.—In provinces where coal occurs the size of holdings is laid down, together with the conditions of work and rental under which they may be held. In Quebec, ordinary mining claims give rights to all mineral substances and to their development, and stakings for combustible natural gas, salt, coal, mineral oil or naphtha, or iron sands may cover 1,280 acres per claim. Royalties are sometimes provided for. Acts or regulations govern methods of production. In the search for petroleum and natural gas an exploration permit or reservation is usually required. However, in Manitoba, Saskatchewan, Alberta and British Columbia leases usually follow the exploration reservation whether or not any discovery of oil or gas is made. In Manitoba, Saskatchewan and Alberta, exploration costs are applicable in part on the first year's rental. In other provinces, the discovery of oil or gas is usually prerequisite to obtaining a lease or grant of a limited area, subject to carrying out drilling obligations and paying a rental, a fee, or a royalty on production.

Quarrying.—Regulations under this heading define the size of holdings and the terms of lease or grant. On Quebec private lands the quarry belongs to the owner; on Crown lands mineral rights belong to the Crown and may be obtained in accordance with the provisions of the law although the rights to exploit peat or marl must be obtained by special licence.

Copies of mining legislation including regulations and other details may be obtained from the provincial authorities concerned.

Section 4.—Statistics of Mineral Production

The importance of mineral production compared with other primary industries in Canada is indicated in Chapter XVI and its part in the foreign trade of Canada is dealt with in Chapter XXI.

Subsection 1.—Value and Volume of Mineral Production

Statistics of the annual value of mineral production are available from 1886, total production being shown for five-year intervals from that date to 1945 and annually for subsequent years in Table 1. These figures are not strictly comparable throughout the period because of minor changes in methods of computing metallic content of ores sold and valuations of products but they do serve to show broad trends in the mineral industry.

The increase in the value of mineral production since the end of World War II has been phenomenal, having more than tripled since 1947. Production per head of the population advanced from \$51.38 in that year to \$137.01 in 1959. Although part of this increase was accounted for by advanced prices, the index of the volume of output from Canadian mines recorded an advance from 78.5 (1949 = 100) to 251.6 in the same comparison.

1.—Value of Mineral Production, 1886-1959

Year	Total Value	Value per Capita	Year	Total Value	Value per Capita	Year	Total Value	Value per Capita
	\$	\$		\$	\$		\$	\$

¹ Beginning with 1935, exchange equalization on gold production is included. production included from 1949.

² Value of Newfoundland

Current Production.—A general review of mineral production during 1958 and 1959 is given at pp. 537-557. As stated there, the value of mineral commodities produced reached a new high in 1959 when it amounted to almost \$2,390,000,000. This was an increase of 13.7 p.c. over the value of \$2,101,000,000 in 1958 and of 9.1 p.c. over the previous peak of \$2,190,000,000 attained in 1957. The greatest gains over 1958 were: nickel, \$63,000,000; iron ore, \$60,000,000; copper, \$59,000,000; uranium, \$45,000,000; petroleum, \$28,000,000; and asbestos, \$14,000,000.
